

My Phd on deformable models

Davide Zerbato PhD student
Altair Laboratory
Università degli studi di Verona

- Me

- My PhD: Collisions
- My PhD: Modal Analysis
- Our Work at Altair Lab
- GPUs
- The Simulator
- Future work
- The end

- ✦ I come from Verona, Italy,
- ✦ I got my Master of Science with a thesis on **mass-spring models calibration**,
- ✦ My PhD will be about deformable models for haptic simulations,
- ✦ I am still working on the state of art.

My PhD: Collisions

- Me
- My PhD: Collisions
- My PhD: Modal Analysis
- Our Work at Altair Lab
- GPUs
- The Simulator
- Future work
- The end

- ✦ It is difficult to compute **collision detection and response**,
- ✦ Surgical simulators often limit the interaction with one tissue/organ.
- ✦ I will investigate the use of **deformable models** with **multibody dynamics** algorithms, to allow more complex simulations.

My PhD: Modal Analysis

- Me
- My PhD: Collisions

- GPUs
- The Simulator
- Future work
- The end

- Currently I want to use **modal analysis** on finite element models to obtain a closed form solution suitable for such algorithms.
 - It allows to obtain **high frame rate**
 - It allows **model simplification**
 - It provides the **analitical solution** at each timestep
- But
 - Modal analisys works well for **linear models**,
 - It does not handle topological changes.

Our Work at Altair Lab

- The Simulator
- Future work
- The end

- ✦ I collaborate with Altair Lab. Of University of Verona to develop a **simulator with haptic feedback** that allows to **touch** soft tissues.

We use

- ✦ RTAI Linux,
- ✦ 2 NASA JPL FRHC joystick,
- ✦ GPU implementation of mass spring model.

● GPUs

- The Simulator
- Future work
- The end

- GPUs (Graphic Processing Unit)
- Are vectorial processors installed on graphic cards.
- They can perform **fast parallel computations**
- But
 - They impose constraint on the **data structure** that can be used,
 - They do **not perform branching prediction**,
 - Usually the code has to be completely rewritten.

The Simulator

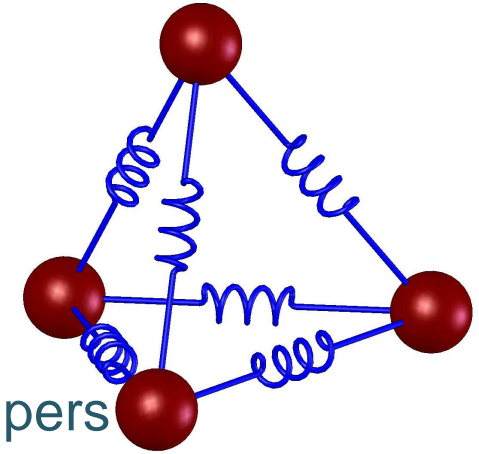

- Me
- My PhD: Collisions
- My PhD: Modal Analysis
- Our Work at Altair Lab
- GPUs
- The Simulator
- Future work
- The end

- ✦ We use a **mass spring model** with dampers and volume preservation,
- ✦ We perform collision detection and response
 - ✦ between the tool and the soft tissue
 - ✦ between the soft tissue and rigid structures (bones).
- ✦ With a model of 7.7 K points, 48 K springs and **38 K tetrahedra** we reach a frequency of **2 KHz** on a Nvidia 8800 GTX.

The Simulator

- Me
- My PhD: Collisions
- My PhD: Modal Analysis
- Our Work at Altair Lab
- GPUs
- The Simulator

Future work

- Me
- My PhD: Collisions
- My PhD: Modal Analysis
- Our Work at Altair Lab
- GPUs
- The Simulator
- Future work
- The end

- In the future we want to
 - Introduce **realistic tool** models
 - **Improve the communication** between Simulator and Master
 - Add some **other (rigid?) organs** to the environment
 - Allow the user to **cut tissue**

The end
