# Decimal Floating-Point Adder and Multifunction Unit with Injection-Based Rounding 

Liang-Kai Wang and Michael J. Schulte University of Wisconsin-Madison ARITH-18, Montpellier, France

## Outline

- Motivation
- Related Research
- Algorithm for Decimal Floating-Point (DFP) Adder and Multifunction Unit
- Hardware Design
- Experimental Results and Analysis
- Conclusions

## Motivation

- Imbortant in business applications

$$
=0.2_{10}=0.00110011 \ldots 2
$$

- The IEEE P754 floating-point standard
- Three DFP formats: 34-digit decimal128 format, 16-digit decimal64 format (this paper), and 7digit decimal32 format
- Decimal floating-point software is slow
- Decreasing transistor costs

## Previous Research and Proposed

## Design

- Previous designs
- Focus on fixed-point addition and subtraction
- For example, [Adiletta89], [Schmookler71]
- [Thompson04] presents the first IEEE P754 compliant DFP adder
- We propose an DFP multifunction unit that
- Supports eight DFP operations
- add, sub, quantize, sameQuantum, roundTolntegral, minNum, maxNum, and compare
- Optimizes significand alignment
- Applies decimal injection-based rounding
- Uses a decimal flag-tracing mechanism

## DFP Adder and Multifunction Unit

$$
S A=\operatorname{sign} \text { of } A
$$

$$
S B=\text { sign of } B
$$

$$
E A=\text { exponent of } A
$$

$$
E B=\text { exponent of } B
$$

$$
\mathrm{CA}=\text { significand of } \mathrm{A}
$$

$$
C B=\text { significand of } B
$$

## Backward format conversion

## Operand Alignment

- Decimal operands are not normalized
- Operand alignment calculation
- E.g. LA $=5$, $\mathrm{EA}-\mathrm{EB}=9$

$A=C A \times 10^{\mathrm{EA}}=\underset{\text { LA }}{\stackrel{\mathrm{a}_{\mathrm{i}-1} \ldots \mathrm{a}_{0} 00000}{\longleftrightarrow}} \times 10^{\text {EA- }-5}$

## Pre-correction

- Effective operation = SA $\oplus$ SB $\oplus O P$
- Place operands based on effective operations simplifies result shifting
- Inject value into the digit positions, R and $S$, based on rounding modes replaces rounding by truncation.

## Pre-correction

- Injection value

| Sign $_{\text {inj }}$ | Rounding Mode | Injection Value <br> $(R, S)$ |
| :---: | :---: | :---: |
| $\mathbf{X}$ | TowardZero | $(0,0)$ |
| $\mathbf{X}$ | TieToAway | $(5,0)$ |
| $\mathbf{X}$ | TieToZero | $(4,9)$ |
| $\mathbf{X}$ | TieToEven | $(5,0)$ |
| - | $+\infty$ | $(0,0)$ |
| + | $-\infty$ | $(9,9)$ |
| - | $+\infty$ | $(9,9)$ |
| + | $-\infty$ | $(0,0)$ |
| $X$ | AwayZero | $(9,9)$ |

- Operands are corrected to generate correct carry-out

$$
\left(C A_{3}\right)_{i}=\left\{\begin{array}{ll}
\left(\boldsymbol{C A}^{\prime}\right)_{i}+6 & \text { If EOP }=\text { add } \\
\left(\boldsymbol{C A}_{2}\right)_{i} & \text { Otherwise }
\end{array} \quad\left(\boldsymbol{C B}_{3}\right)_{i}= \begin{cases}\left(\boldsymbol{C B ^ { \prime }}\right)_{i} & \text { If EOP }=\text { add } \\
\overline{\left(C B_{2}^{\prime}\right)_{i}} & \text { Otherwise }\end{cases}\right.
$$

## Carry Propagation Network

- Kogge-Stone parallel prefix network
- Two sets of flags
- Flag $F_{1}$ handles the digit increment in the post-correction stage.
- Flag $F_{2}$ handles the carry propagation from the injection correction value.

## Post-correction

- Compensate the result from the K-S network
- Rule 1: effective operation is ADD
- Subtract 6 from digit $i$ for which $\left(C_{1}\right)_{i+1}$ is 0
- Rule 2: effective operation is SUB
- If the result is positive
- Increment the result using $\mathrm{F}_{1}$
- Subtract 6 from digit $i$ for which $\left(\mathrm{C}_{1}\right)_{\mathrm{i}+1} \oplus\left(\mathrm{~F}_{1}\right)_{\mathrm{i}} \equiv 0$
- If the result is negative
- Invert all bits of the result
- Subtract 6 from digit $i$ for which $\left(\mathrm{C}_{1}\right)_{\mathrm{i}+1} \equiv 1$

## Shift and Round

- Most significant digit is zero
- No action is needed
- Most significant digit is non-zero
- Requires an injection correction step

## Shift and Round

- Injection correction value for different rounding modes

| Sign $_{\text {inj }}$ | Rounding Mode | Injection Correction Value <br> $(\mathbf{G}, \mathbf{R}, \mathbf{S})$ |
| :---: | :---: | :---: |
| $\mathbf{X}$ | TowardZero | $(\mathbf{0 , 0 , 0 )}$ |
| $\mathbf{X}$ | TieToAway | $(4,5,0)$ |
| $\mathbf{X}$ | TieToZero | $(4,5, \mathbf{0})$ |
| $\mathbf{X}$ | TieToEven | $(4,5,0)$ |
| - | $+\infty$ | $(0,0,0)$ |
| + | $-\infty$ | $(9,0,0)$ |
| - | $+\infty$ | $(9,0,0)$ |
| + | $-\infty$ | $(0,0,0)$ |
| $\mathbf{X}$ | AwayZero | $(9,0,0)$ |

- Injection correction value may trigger carry propagation
- Flag $F_{2}$ eliminates carry propagation

## Comparison

|  | Thompson's Design | This Design |
| :--- | :--- | :--- |
| Supported DFP <br> Operations | 2: add, subtract | 8: add, subtract, minNum, <br> maxNum, compare, quantize, <br> sameQuantum, roundToIntegral |
| Internal format | Excess-3 encoding | BCD encoding |
| Operand <br> Alignment | Exponent computation and <br> LZD in series | Exponent computation and LZD in <br> parallel |
| Carry-propagate <br> network | Kogge-Stone with flag <br> tracing for post-correction | Two extra flags for rounding |
| Rounding | Random logic and decimal <br> incrementer. | Injection-based rounding with <br> correction. |
| Overflow <br> Detection | After result is rounded | Before the result is rounded |

## Extension to Support More DFP Operations

## - TolntegralValue(A)

- Round $A$ to an integer value
- ToIntegralValue ( $13545 \times 10^{-3}$ ) $=14$ with round-ties-to-even
- Design strategy
- Set $\mathrm{CB}_{1}$ and $\mathrm{EB}_{1}$ to zero
- Enable right shift even if $C B_{1}=0$
- Set effective operation to ADD
- Quantize (A, B)
- Change EA to EB
- Quantize $\left(12345 \times 10^{-4}, 1 \times 10^{-2}\right)=123 \times 10^{-2}$ with round-down
- Design strategy
- Set $\mathrm{CB}_{1}$ to zero
- Enable right shift even if $\mathrm{CB}_{1}=0$
- Set effective operation to ADD

## Extension to Support More DFP Operations

- SameQuantum(A, B)
- Check if EA 三EB
- Generate an extra flag in the operand alignment stage
- minNum, maxNum, and compare use the original datapath
- Many changes are made to exception flag logic
- A post-processing unit is added to handle special operands such as infinity and Not-aNumber

## Block Diagram of the DFP Adder and Multifunction Unit

## Hardware Implementation

- Modeled using RTL Verilog and simulated using Modelsim
- Synthesized using LSI Logic's 0.11um Standard Cell Library and Synopsys Design Compiler
- Tested using a comprehensive testbench generator and the decNumber library 3.32

## Delay and Area Comparison

## - Combinational circuit designs

| Metric | Thompson's adder | Injection-based adder | Improvement |
| :--- | :--- | :--- | :--- |
| Delay (comb.) | $3.50 \mathrm{~ns}, 63.6$ FO4 | $2.76 \mathrm{~ns}, 50.2$ FO4 | $21.0 \%$ |
| Area | 22443 NAND eq. gates | 22086 NAND eq. gates | $1.6 \%$ |

Table 1. Improvement over Thompson's Design

| Metric | Injection-based adder | Multifunction Unit | Overhead |
| :--- | :--- | :--- | :--- |
| Delay | 2.76 ns, 50.2 FO4 | $2.84 n s, 51.6$ FO4 | $2.8 \%$ |
| Area | 22086 NAND eq. gates | 24233 NAND eq. gates | $9.7 \%$ |

Table 2. Overhead of the Multifunction Unit Compared to the Injection-based Adder

## Cycle Times vs. Pipeline Depth

- Synthesized using the pipeline_design command from the Synopsys Design Compiler

## Conclusion

- A 16-digit DFP adder and multifunction unit compliant with the IEEE P754 standard
- Novel features:
- Delay optimization in the operand alignment, rounding, and overflow detection units
- A modified injection-based rounding method
- Extensions to support multiple DFP operations
- Design analysis
- 21\% delay improvement over Thompson's design
- $2.8 \%$ delay overhead for DFP multifunction unit

Questions?

## Backup Slide

- More on Forward Conversion
- More on Operand Alignment
- More on Post-correction
- More on Carry Propagation Network
- More on Overflow Detection
- More on Sign and Backward Conversion
- More on Extension to Support More DFP Operations
- More on Area Comparison

## Forward Format Conversion

- Extract sign bits, biased exponents, and significands from operands in the IEEE format
- Combination field $\boldsymbol{G}$ contains the classification of a number, the encoding information, the most significant digit of significand and a biased exponent.
- Trailing significand field $\boldsymbol{T}$ encodes a significand using Densely Packed Decimal (DPD) encoding. DPD encoding represents three digits using ten bits.
- Convert significands in DPD encoding to the BCD encoding
- Generate flag signals for special operands (signaling NaN , quiet NaN , zero, and infinity)

## Operand Alignment and Pre-correction

- Operands are shifted using one 16-digit leftshift and one 18-digit right-shift decimal barrel shifters.
- Guard and round digits, and sticky bit are generated. CB becomes a 18-digit operand with a sticky bit.
- Operands are placed based on the effective operation flag to simplify the rounding.

## Operand Alignment and Pre-correction

## Validity of Post-correction

- Add:
- At Pre-correction: $A_{i}+B_{i}+6$
- If digit carry is $0, A_{i}+B_{i}+C_{i-1}<10$, subtract 6 from Sum $_{i}$
- Sub:
- Expect: A + (10... 0 - B)
- At Pre-correction: A + (9...9-B) + 6... 6
- If carry out of MSD is 1 ,
- Result is positive. Add the late carry-in from the LSD.
- If the digit sum after incrementing the late carry-in is less than $10(A+(9-B)+6+C<10)$, subtract 6 from Sum

## Validity of Post-correction

## - Else

- Result is negative. Invert Sum. Sum $_{i}=15-\left(A_{i}+15-B_{i}+C_{i-}\right.$ 1) $=B_{i}-A_{i}-C_{i-1}$
- If $B_{i}-\left(A_{i}+C_{i-1}\right)<0$
- Need to borrow from the next digit
$-25>=15-\left[B_{i}-\left(A_{i}+C_{i-1}\right)\right]>=16 \rightarrow 9>=$ Sum $>=0$. This generates a carry to the next digit.
- After inverting, $F>=$ Sum $_{i}>=6$. Need to subtract 6
- Else,
- No borrow from the next digit
$-15>=15-\left[B_{i}-\left(A_{i}+C_{i-1}\right)\right]>6$, No carry is generated
- After inverting, $9>=$ Sum $_{i}^{\prime}>=0$. No subtraction is needed.
- E.g $135-424=135+b d b=d 10$ with 011 as borrow signals. After inversion, d10 $\rightarrow$ 2ef. Subtract by six on two LSDs, 2ef $\rightarrow 289$

## Carry Propagation Network

- Use Kogge-Stone parallel prefix network
- Three sets of flags in addition to the carry bits are generated.
- Flag $F_{1}$ handles the digit increment in the post-correction stage to increment results and is generated from the propagate bits.

$$
\begin{aligned}
& \left(P_{x}\right)_{i}=\left(P_{x-1}\right)_{i} \wedge\left(P_{x-1}\right)_{i-2^{x}} \text { where } x=4 \ldots 0 \\
& F_{1}=\left(P_{4}\right)_{i}
\end{aligned}
$$

- Flags $F_{2}$ traces the trailing nine of the result before the postcorrection stage.

$$
\left.\begin{array}{l}
i=19 \ldots 4 \\
\left(\text { flagADD }_{0}\right)_{i}=\left((U C R)_{i} \equiv 15\right)_{\vee}\left((U C R)_{i} \equiv 9\right)_{\wedge}\left(\left(C_{1}\right)_{i+1}\right) \\
\left(\text { flagSUB }_{0}\right)_{i}=\left\{\begin{array}{l}
\left((U C R)_{4} \equiv 15\right)_{\wedge}\left(P_{3} \equiv 0\right) \vee\left((U C R)_{4} \equiv 14\right)_{\wedge}\left(P_{3} \equiv 1\right) \\
\left((U C R)_{i} \equiv 15\right), i=19 \ldots 5
\end{array}\right. \\
\left(\text { flagADD }_{x}\right)_{i}=\left(\text { flagADD }_{x-1}\right)_{i} \wedge\left(\text { flagADD }_{x-1}\right)_{i-2^{x-1}}, \text { where } X=1 \sim 4 \\
\left(\text { flagSUB }_{x}\right)_{i}=\left(\text { flagSUB }_{x-1}\right)_{i} \wedge\left(\text { flagSUB }_{x-1}\right)_{i-2^{x-1}}
\end{array}\right\} \begin{aligned}
& F_{2}= \begin{cases}f_{\text {flagADD }}^{4} & \text { EOP }=\text { ADD } \\
\text { flagSUB }_{4} & \text { EOP }=\text { SUB }\end{cases}
\end{aligned}
$$

## Overflow Detection

- Injection-based rounding simplifies the overflow detection
- The result is overflow before rounding (carryout is generated from the most significant digit of the result)
- Not influenced by the injection correction value
- The result is overflow after rounding
- Handle by the injected value
- Overflow detection can examine the result before the rounding unit

## Sign and Backward Conversion

- Sign bit is determined by the signs of operands, the rounding mode, and if either of the operands is normal numbers.
- Sign $=(!E O P \cap$ SignA $) \cup(E O P \cap((E A \geq E B) \oplus$ SignA $\oplus$ carryout)
- Backward conversion combines the sign bit, the exponent, and the significand to form the P754 compliant result.

## Extension to Support More DFP Operations

- Quantize (A, B)
- Change the unit of $A$ to $E B$
- Set CB to zero
- Enable right shift even if $C B=0$
- Set effective operation to ADD to avoid wrong rounding operations
- SameQuantum(A, B)
- Check if $E A \equiv E B$
- Generate an extra flag in the operand alignment stage.
- MinNum, MaxNum, and Compare
- Set the operator to SUB and observe the sign
- TolntegralValue(A)
- Round $A$ to an integer value
- Set CB and EB to zero
- Enable right shift even if $C B=0$
- Set effective operation to ADD to avoid wrong rounding operations
- Many changes to the conditions of exception flags are added. The postprocessing unit is added to handle special operands such as infinity and Not-a-Number.

## Area Comparison

## Comparison with Software (IBM's decNumber library)

- decNumber library using the SimpleScalar simulator with PISA architecture

| DFP <br> Operations | Software | Hardware |  | Improvement |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Fast | Slow | Fast | Slow |
| ADD | 499.4 | 4 | 6 | 124.9 | 83.2 |
| SUB | 496.2 |  |  | 124.1 | 82.7 |
| Quantize | 265.4 |  |  | 66.4 | 44.2 |
| SameQuantum | 89.4 | 1 | 1 | 89.4 | 89.4 |
| TolntegralValue | 364.6 | 4 | 6 | 91.2 | 60.8 |
| MaxNum | 405.4 |  |  | 101.4 | 67.6 |
| MinNum | 643.1 |  |  | 160.8 | 107.2 |
| Compare | 282.8 |  |  | 70.7 | 47.1 |

## Comparison with Software (Intel's BID library)

- Intel's BID library and EM64t Xeon 5100 3.0GHz
- Results taken from their paper

| DFP <br> Operations | Software |  | Hardware |  | Improvement |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Fast | Slow | Fast | Slow | Max | Min |
| ADD | 71 | 133 | 4 | 6 | 33.3 | 11.8 |
| SUB | 71 | 133 |  |  | 33.3 | 11.8 |
| Quantize | 27 | 45 |  |  | 11.3 | 4.5 |
| TolntegralValue | 27 | 45 | 4 | 6 | 11.3 | 4.5 |
| MaxNum* | 75 | 113 |  |  | 28.3 | 12.5 |
| MinNum* | 69 | 108 |  |  | 27 | 11.5 |

## Other DFP Operations

- Other DFP operations that can reuse our DFP adders include:
- nextUp
- nextDown
- Other DFP operations that can use our DFP with little extra gate
- ABS
- Negate
