- 1. Introduction**
- 2. Constraints**
- 3. Proposals**
- 4. Missions**
- 5. Conclusions**

1. Introduction

1.1. Existing meso-robots (centimetric)

- Inside the M2A Capsule
1. Optical dome
 2. Lens holder
 3. Lens
 4. Illuminating LEDs (Light-emitting-diodes)
 5. CMOS (complementary metal oxide semiconductor) imager
 6. Battery
 7. Strobe control, video encoder, and RF transmitter IC
 8. Antenna

VECTOR

Figure 6. In the IDEAS (Integrated Diagnostics for Environmental and Analytical Systems) project's Laboratory in a Pill, a plastic shell encapsulates the device electronics. (image courtesy of the IDEAS team)

IDEAS

OLYMPUS

1.2. Projects of micro-robots (millimetric)

ARES
(European project)

Microrobot for Intravascular Treatment
(Korea Inst. of Sci. & Technol., Seoul)

1.3. Research of nano-robots (micronic)

ETH Zurich

Fig. 10. Conceptual assembly of a swimming micro robot for neurosurgery. The components of the robot are: 1) Three swimming tails, 2) Power source (here 5 Renata ZA10 batteries in series), 3) Packaged IC for command control and communication, 4) Antenna, 5) Endoscopic Camera, 6) LEDs, 7) Force sensors, 8) Tool for intervention, 9) Localization sensor (here an Aurora magnetic tracker receiving coil).

(Korea Inst. of Sci. & Technol., Seoul)

2. Constraints

- **Bio-medical environment needs**
 - Non toxicity and non injury
 - Eliminability
 - Safety
 - Disposability (single use)
- **Safety needs**
 - monitoring and control of a mission allocated to a team
- **Microbotics and microworld constraints**
 - Specific physic of the micro-world
- **Embedded energy constraints**
 - Volume (and weight) of containers, quantity of energy, duration

3. Proposal

3.1. Main description

- **Non communication between micro-robots (only broadcasting of informations)**

- **No autonomous move of the micro-robots (use of the body fluidic moves or external fields)**

Sensors

Main controller signals listening
Environment sensors

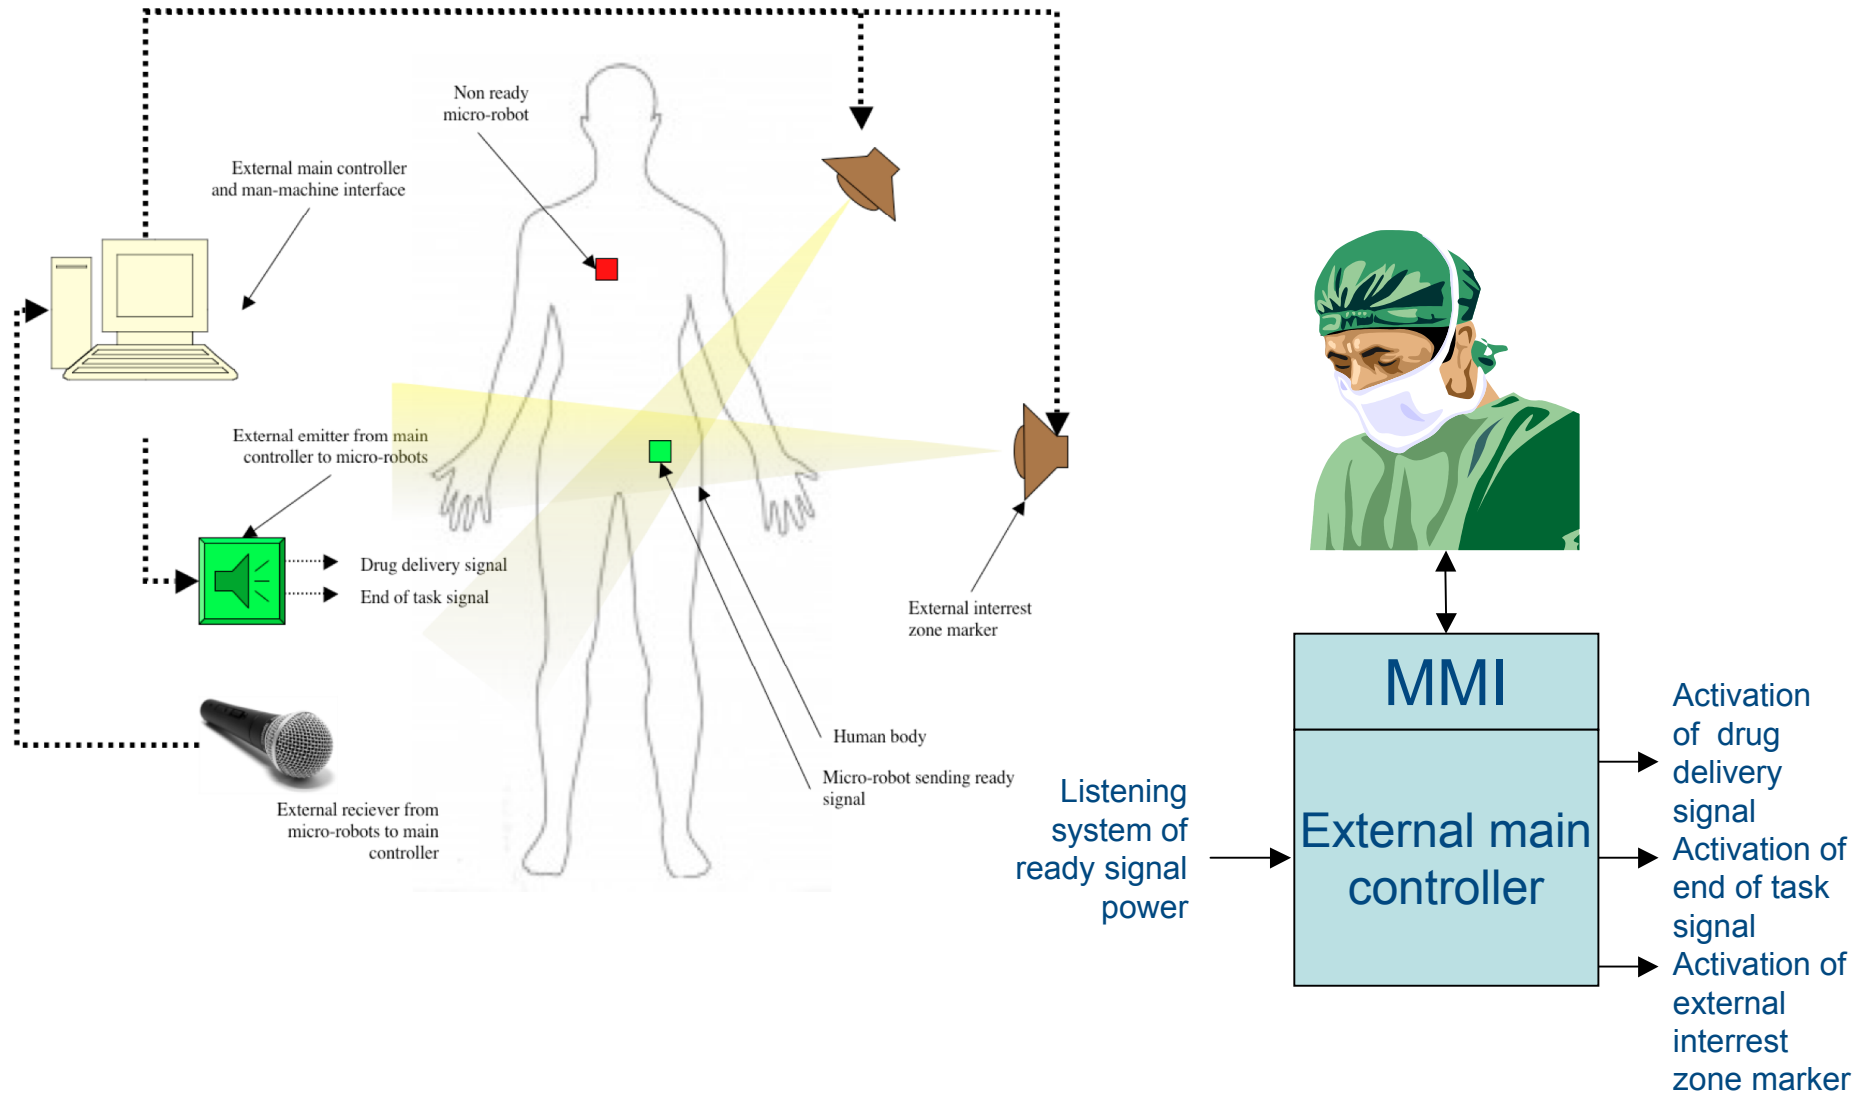

Actuators

Single ready signal sender
One or two digital actuator

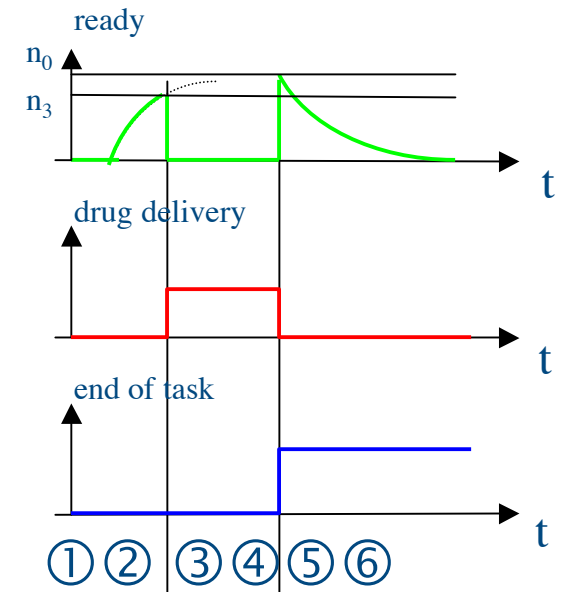

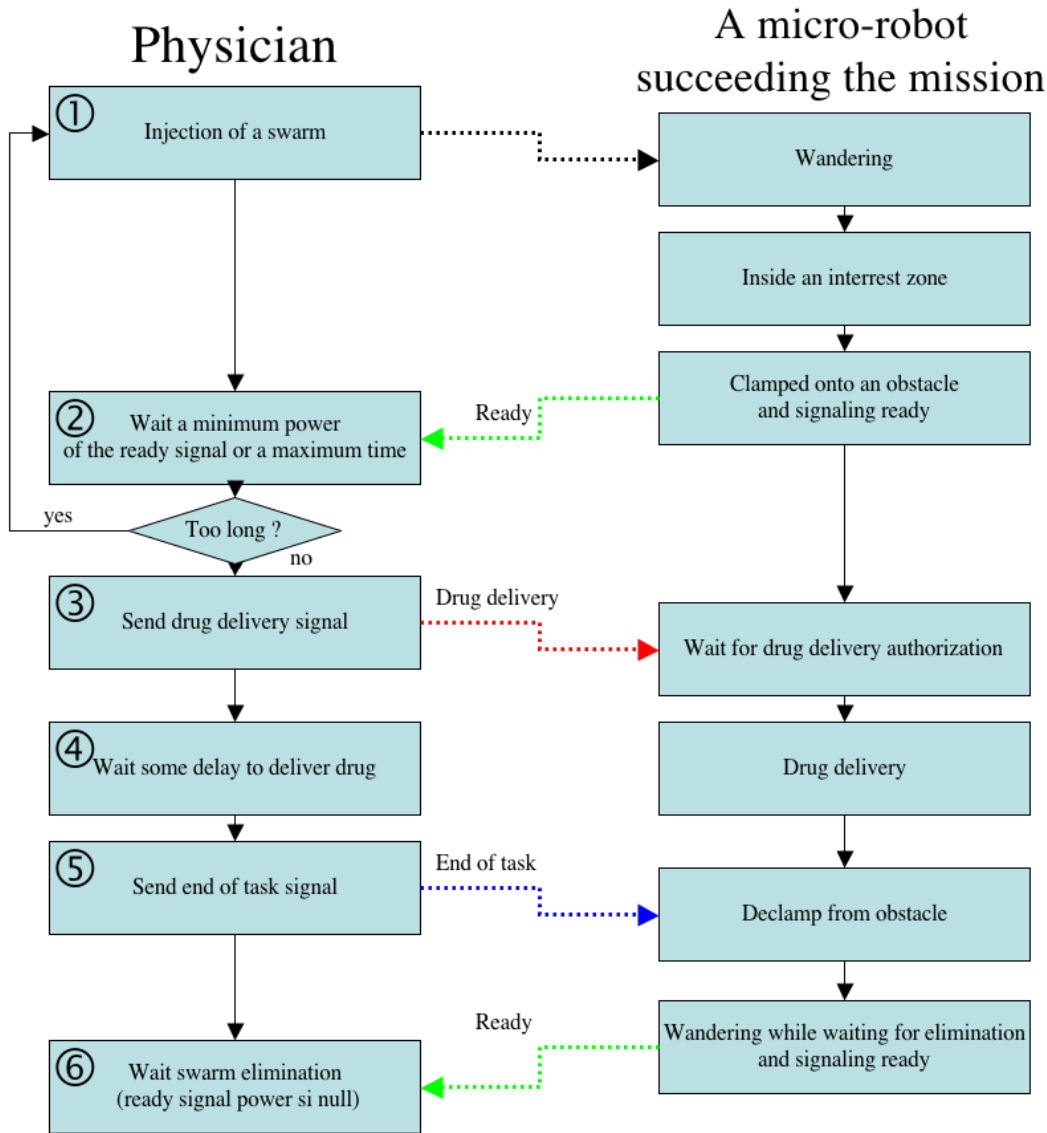

- **Minimalist micro-devices**
- **Mass effect to accomplish a mission**
- **Only the number of ready units can be evaluated (no identification of the units)**
- **The lost of some units is allowed**
- **The elimination of every unit at the end of the mission is required**

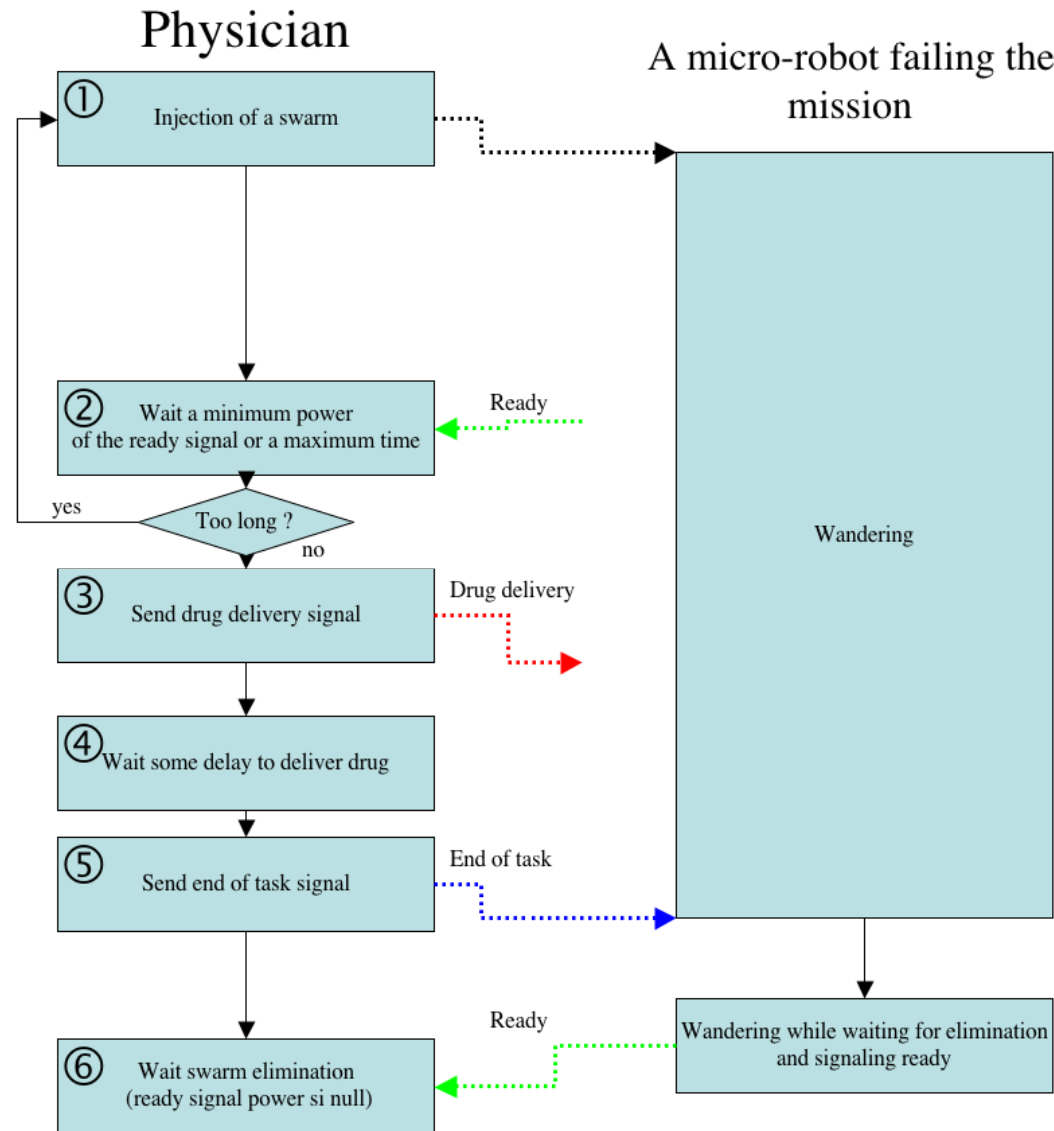

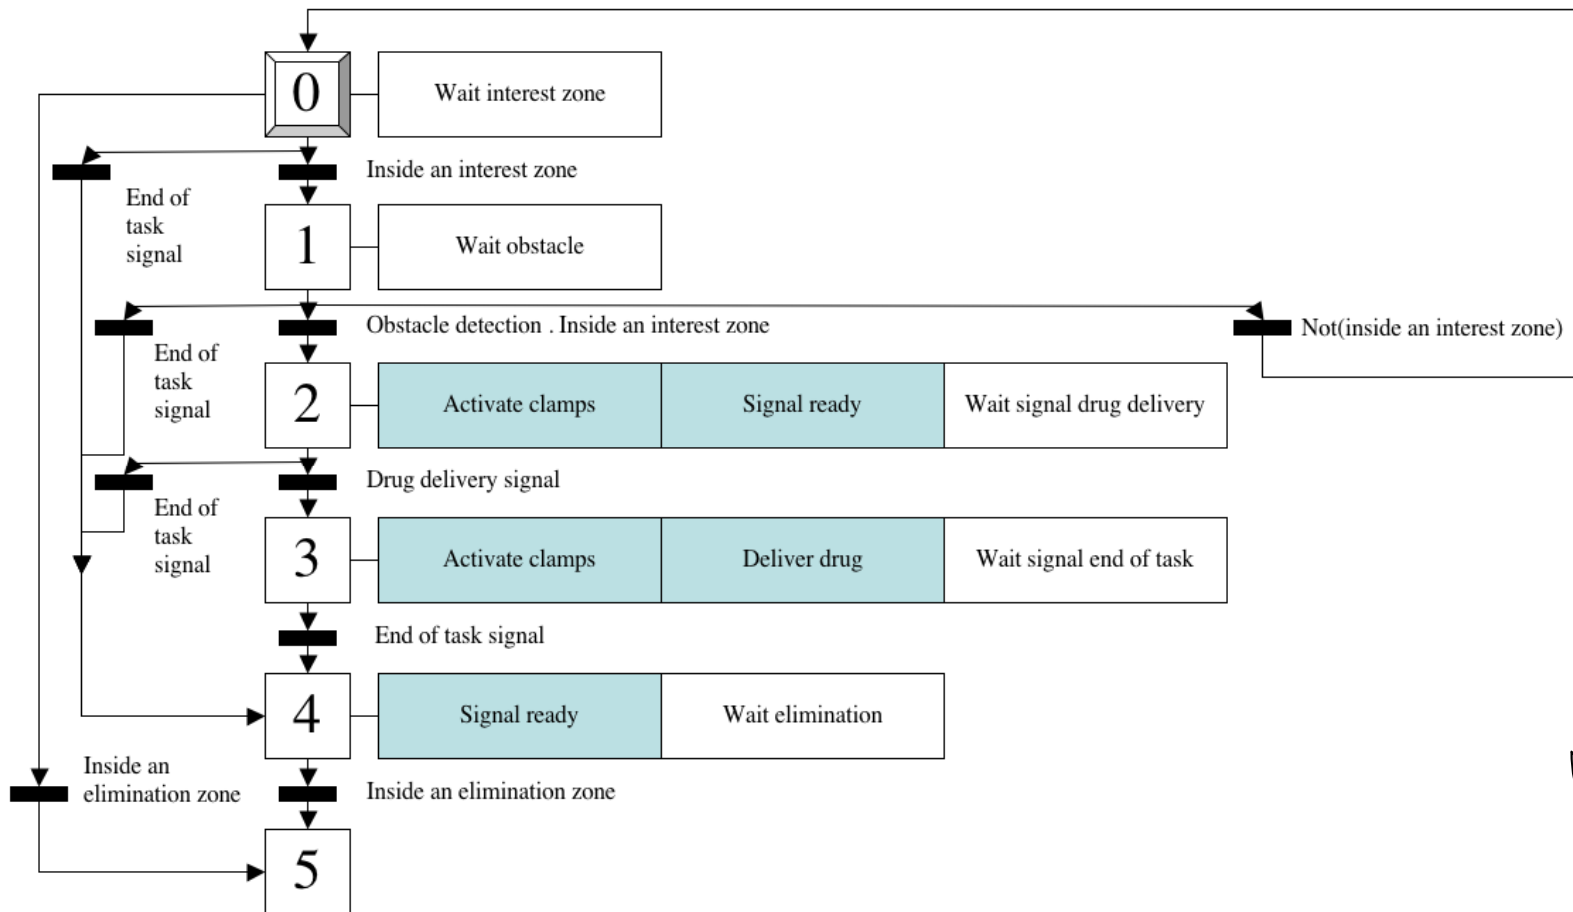

4. Mission example : drug-delivery

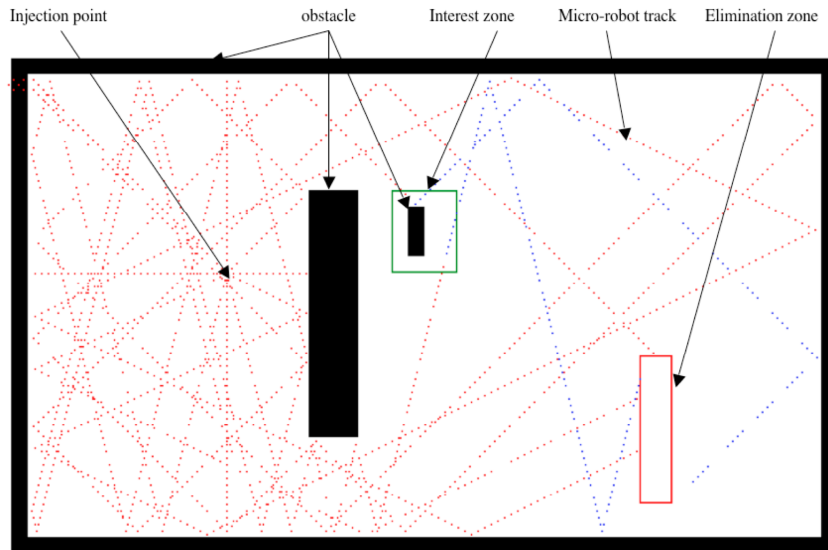

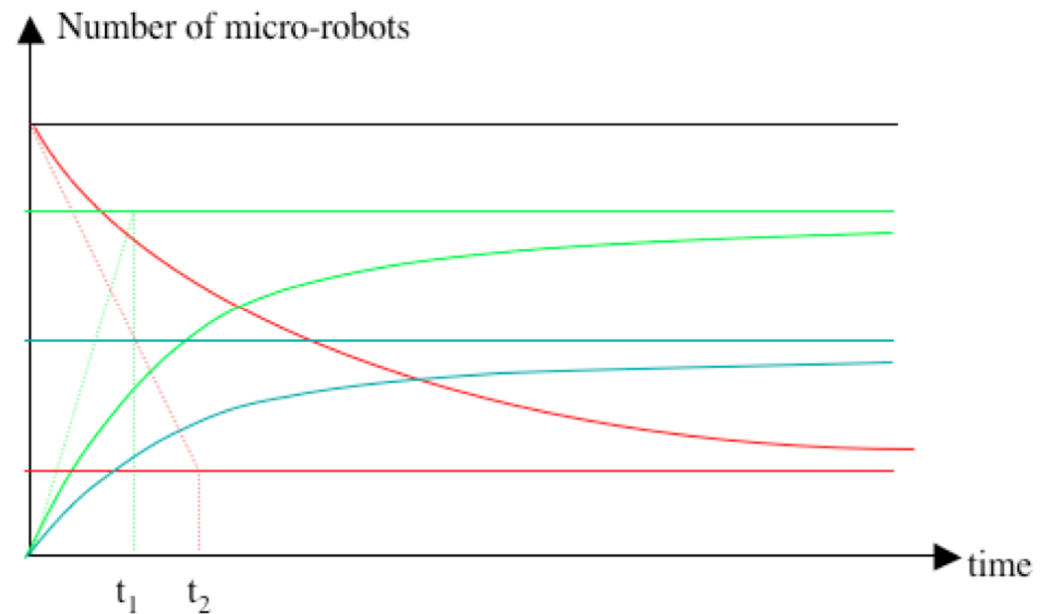

Number of micro-robots that reach the target, without elimination consideration

Number of micro-robots still wandering when including an elimination zone, without target consideration

Number of micro-robots that reach the target, when considering an elimination zone

$N_2 \neq 0 !!$

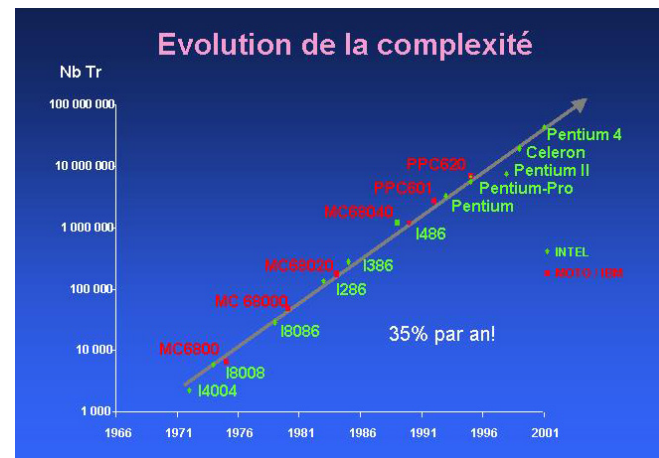

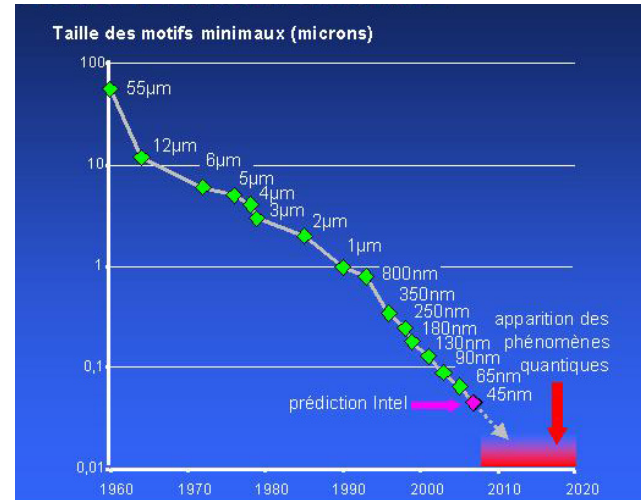

- **Present densities :**

- 1994 Intel Pentium 1994 \Rightarrow 3 millions de transistors
- 1997 Pentium II 1997 \Rightarrow 5 millions on 3 cm^2
- 1997 AMD processeur K6 \Rightarrow 8,8 millions on $1,7 \text{ cm}^2$
- 1 component by 50 nm (2000 maximum smoothness) ; today 25nm
- Then, we assume 10^6 transistors/ $\text{cm}^2 \Rightarrow 10^3$ transistors / μm^2

- **Needs :**

- Realization of a micro-robot CPU onto $1 \mu\text{m}^2$
- 2 transistors by NAND gate (universal gate)
- 1 G7 step : 2 « and » + 1 « or » 2 « not » \Rightarrow 11 NAND \Rightarrow 22 transistors
- 1 G7 transition including 5 inputs \Rightarrow 5 « not », 5 « or including 5 inputs » \Rightarrow 25 NAND \Rightarrow 30 transistors
- 1 output : 1 « or including 5 inputs » \Rightarrow 15 NAND \Rightarrow 30 transistors
- N steps + 1,5 N transitions (5 inputs) + 3 outputs by 1000 transistors
 - $\Rightarrow N*22+1,5*N*30+3*30=1000$

- Then $N = (1000-90)/(22+1,5*30) =$
13 steps on $1 \mu\text{m}^2$ CPU

5. Conclusions

- **Proposition of a kind of smart medicine that only acts where and when it is needed (under physician acknowledgment)**
- **Configurable to many kind of missions**
- **Today, such micro-robots do not exist. Only programs run into a simulation program**
- **Problem of complete elimination of the team**

- **Bring improvements to the simulator**
- **Imagine some other missions. May be, this team may be more efficient if it is an heterogeneous one, with some specialized units**
- **Realize a true team and perform real experiments !**
