

Computer Assisted Hybrid Image Guided Minimally Invasive Surgery

Prof. Luc Soler
IRCAD-IHU R&D Director

University of Strasbourg, France

Presenter Disclosure Slide

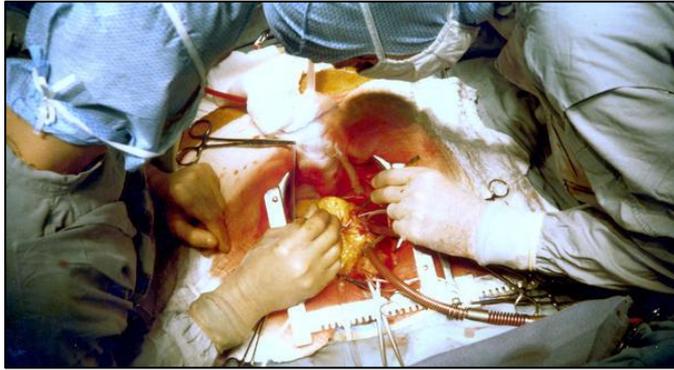

Luc Soler

A part of this work was cofunded by :

- *The European Commission: PASSPORT Project*
- *The French Minister of industry: ISIS Project*
- *The University-Hospital Institute (IHU) of Strasbourg*

*I am also cofounder and CEO of the **Visible Patient Company***

Evolution of Surgery like other Domains

before 1980
Large Incision

1930-1940 :
Large Size

From 1980
Small Incision

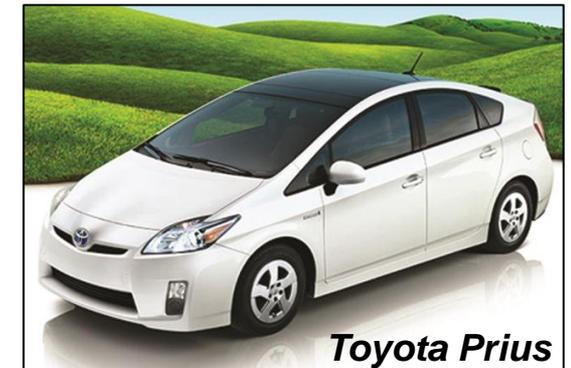

1946-1960 :
Smaller Size

From 2000
Robotisation

Since 1980 :
Robotized

From Hybrid car to Hybrid Surgery

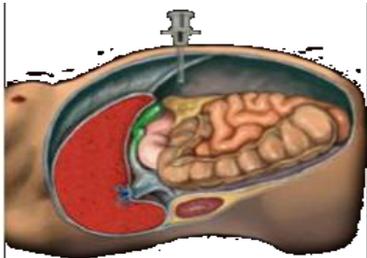

Peugeot hybride

Something having two kinds of components that produce the same or similar results

What is Hybrid Surgery

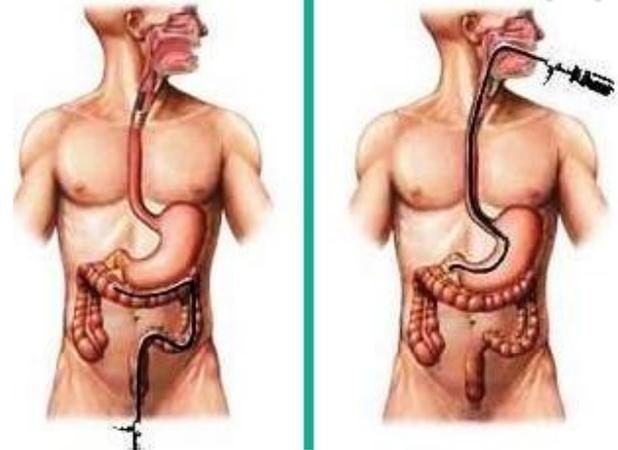

Merging two (or more)
Surgical techniques

Laparoscopic Surgery

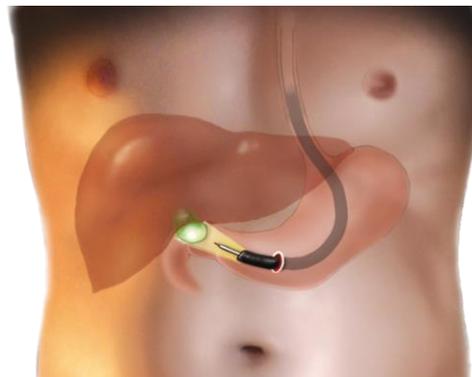

+

Flexible endoscopy

=

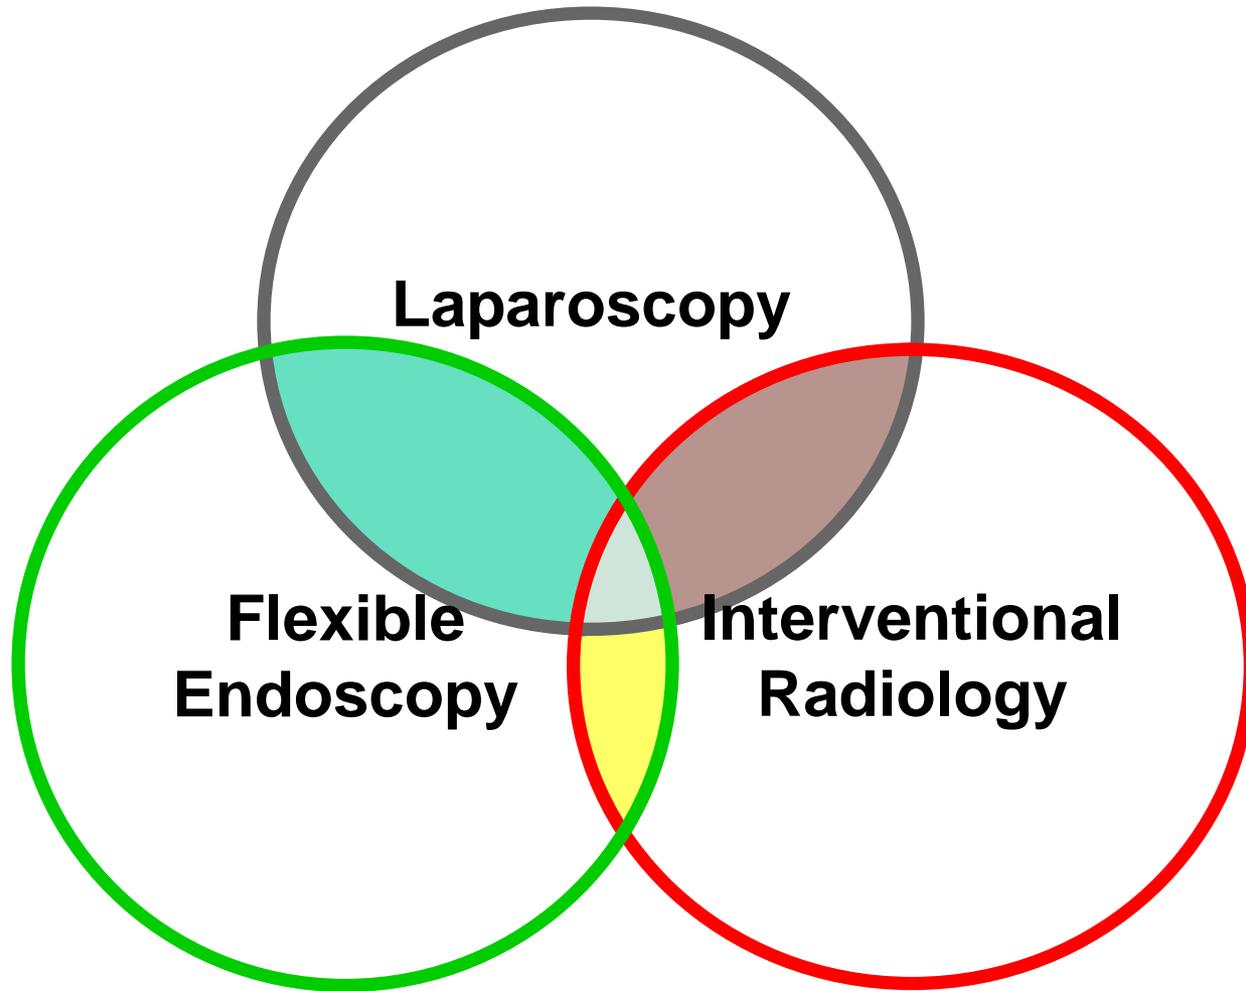

Natural Orifice
Transluminal Endoscopic
Surgery = NOTES

Hybride Minimally Invasive Surgery

Hybride Minimally Invasive Surgery

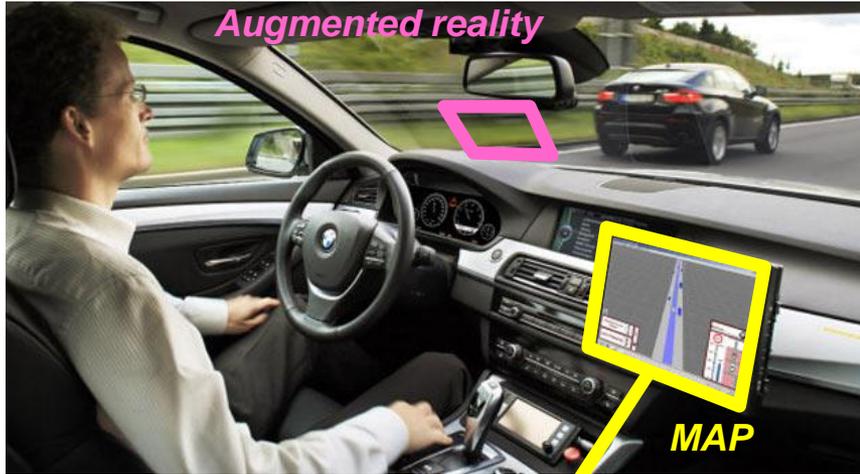

The future is automation (google car)

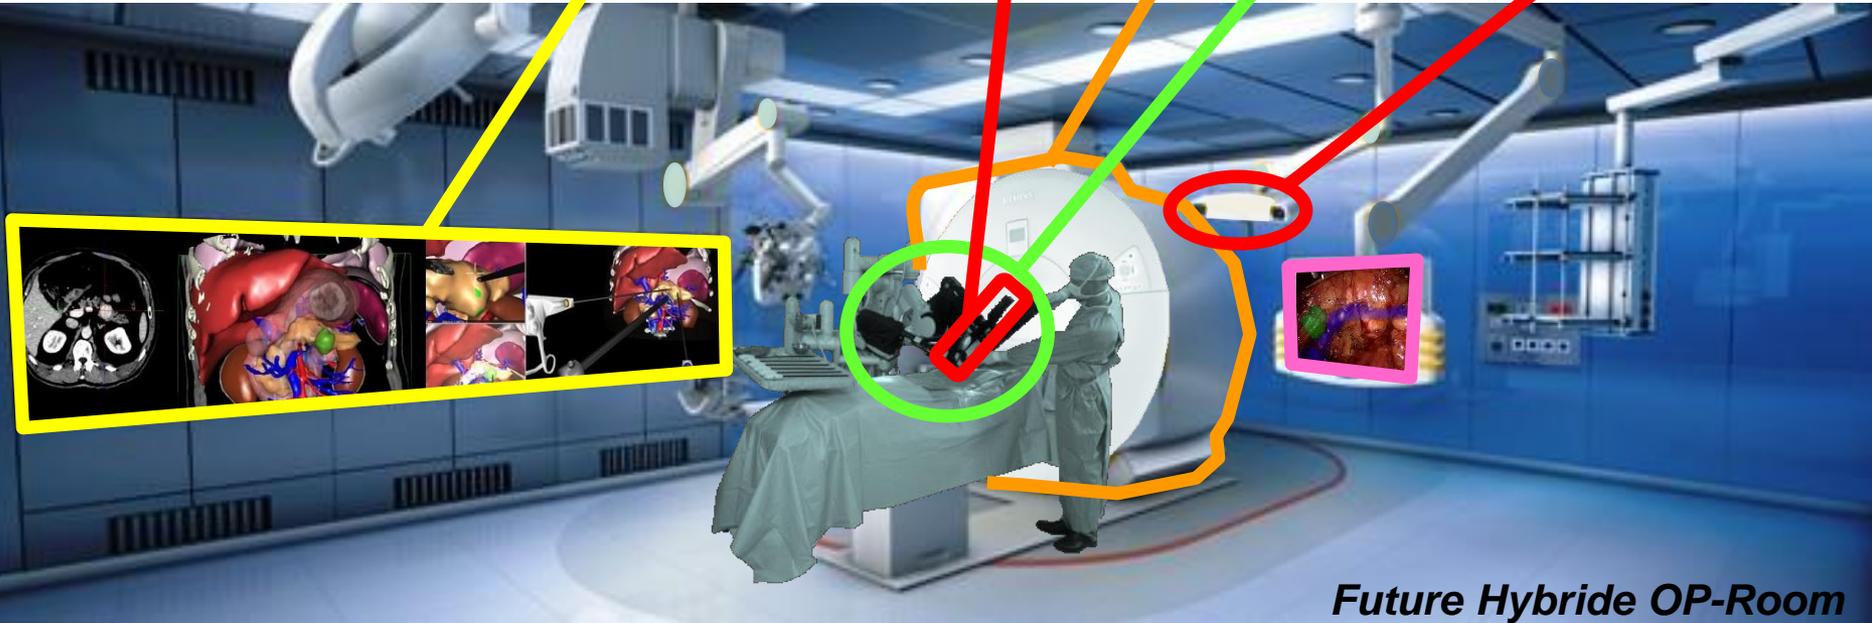

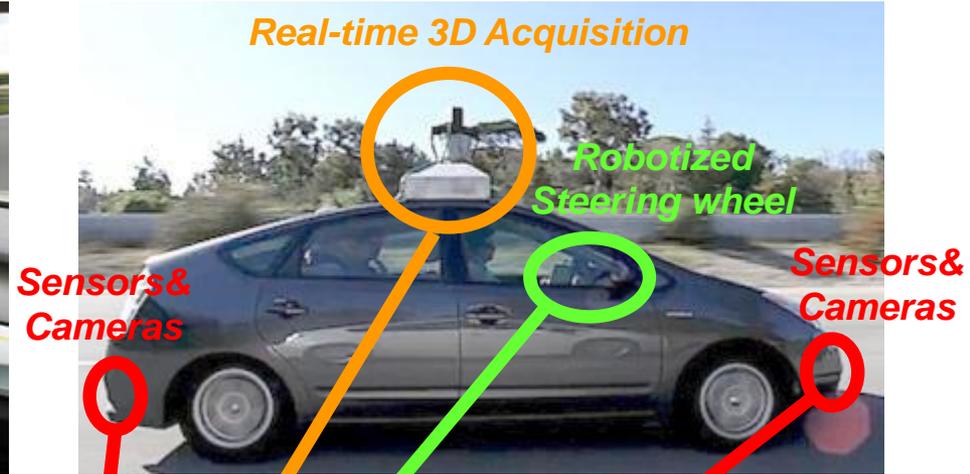

New Technologies can avoid Human errors !

Develop the same concept in surgery

Toyota Google Car

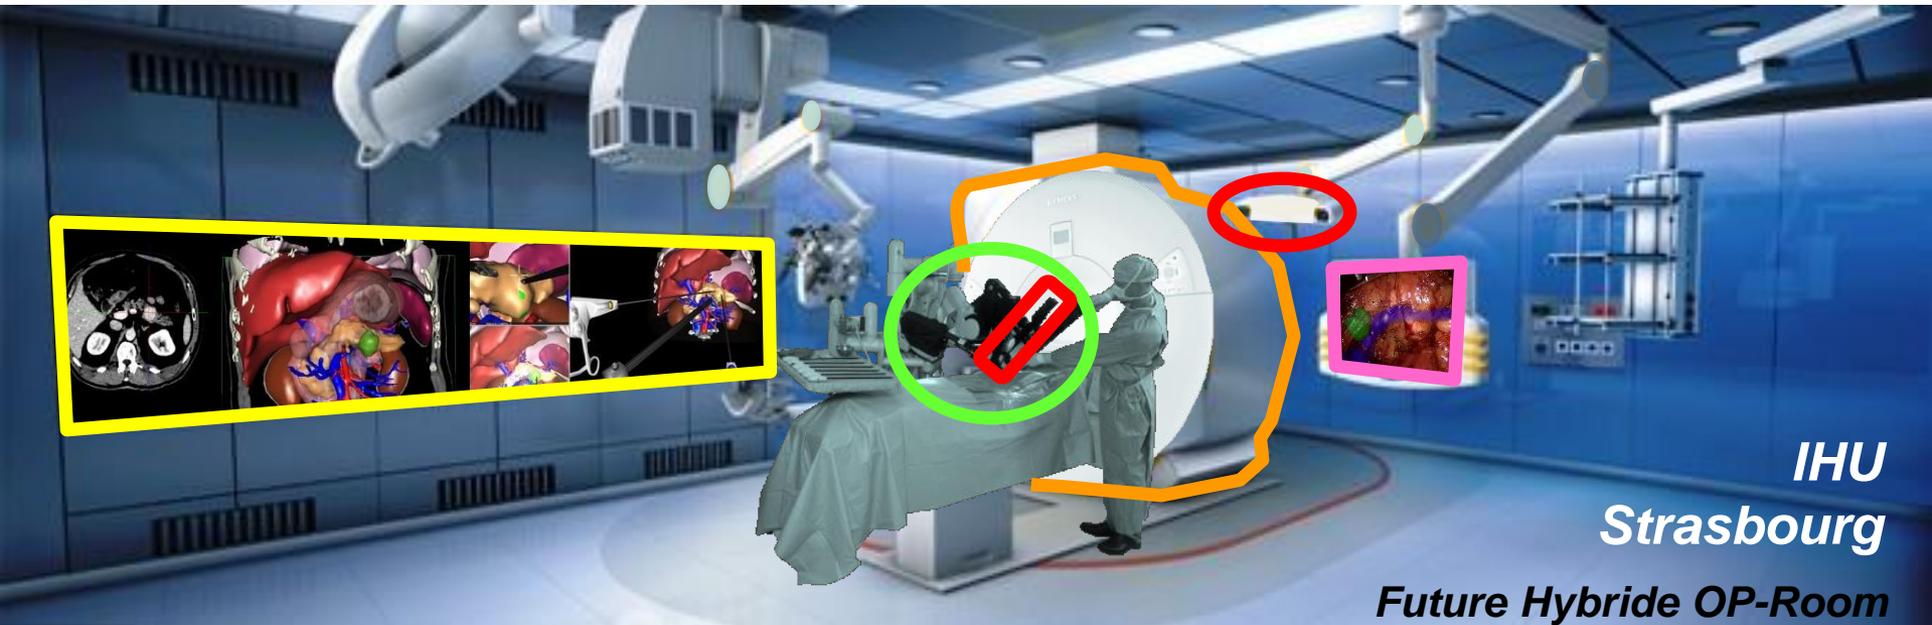

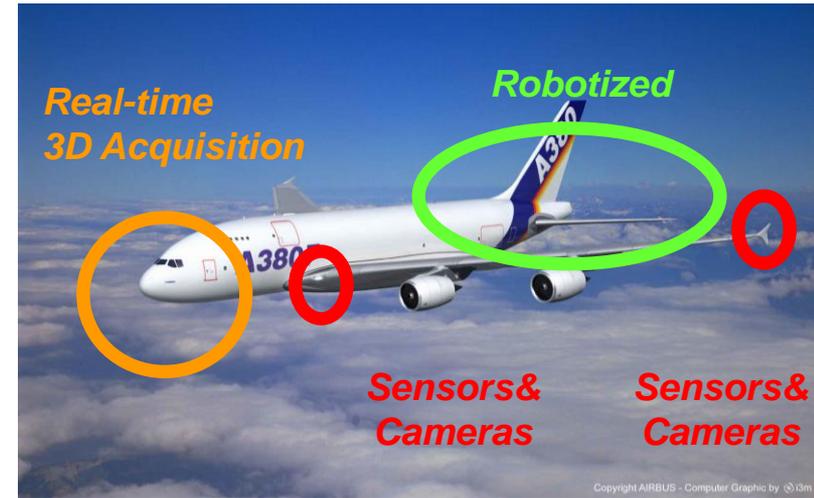

Future Hybride OP-Room

The same concept than aeronautic

Airbus A380

Clinical Validation

Benefit of 3D planification to the surgical resection of liver tumors

Prof. Jean-Jacques Houben, Dr. Thierry Ballet, Dr. Roland Fastrez
Cavell Department of Digestive Surgery

Clinical Validation

Aim : establish the benefit of preoperative liver reconstruction for Radiofrequency Ablation, Liver Resection and Liver Regeneration

17 patients selected among 48 liver tumors

Criteria of selection :

Resection seems not possible or highly complex

Clinical Validation : Results

Requested modelling : 35% of cases

Impact : 27% (76%) of cases

13 procedures modified from initial planning thanks to Virtual modelling and planning.

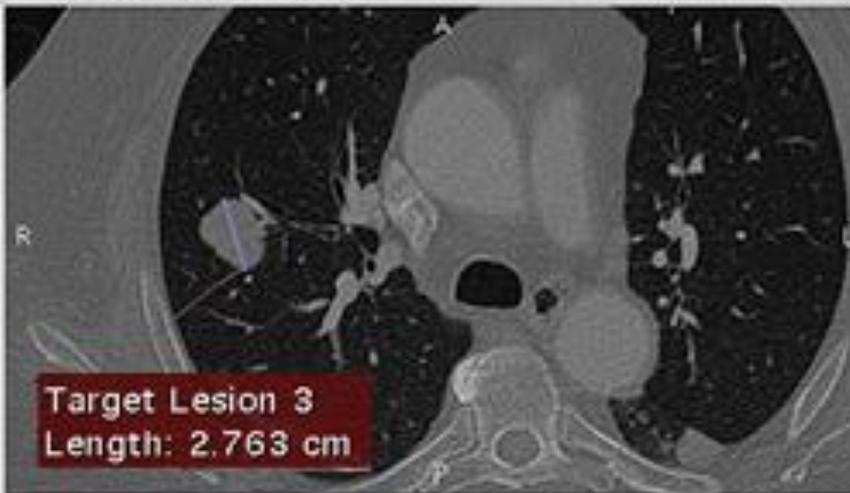

Proof benefit : 20% (59%) of cases

10 with high benefit for safe hepatectomy, confirmed by postoperative Petscan, CEA drop and clinical outcome.

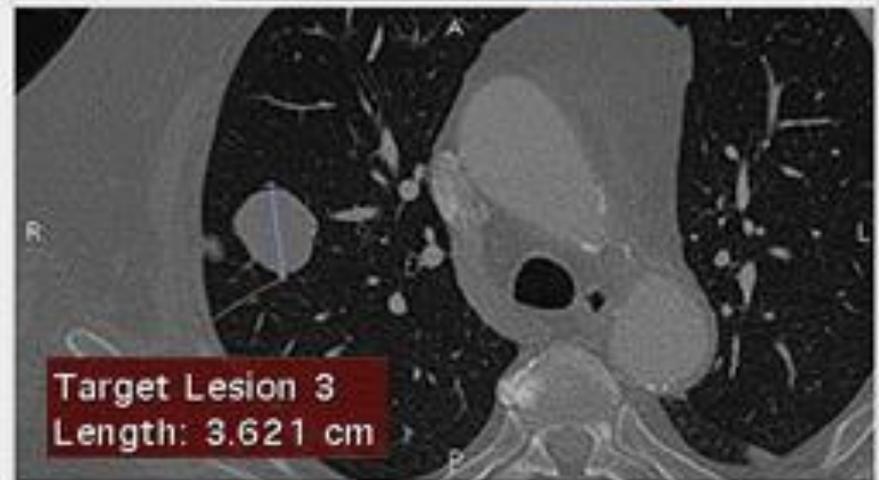

Usual Tumor follow Up : RECIST

ONLY 1D + t

Baseline: 2010-05-05 17:46:22 +0200

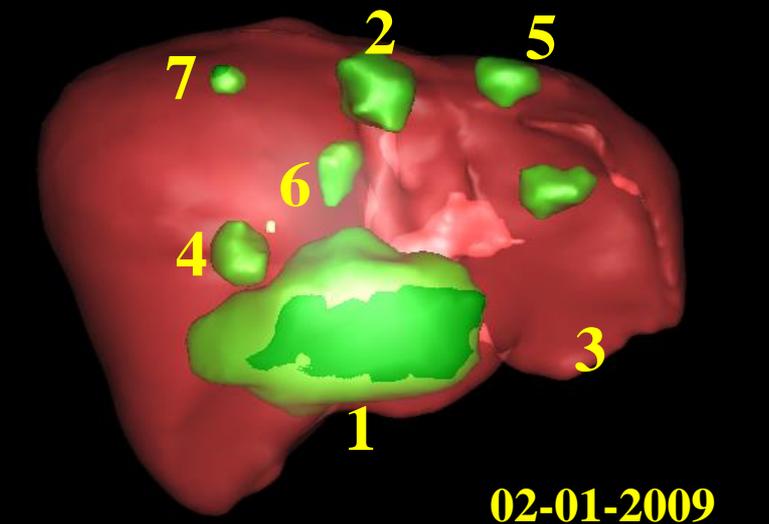

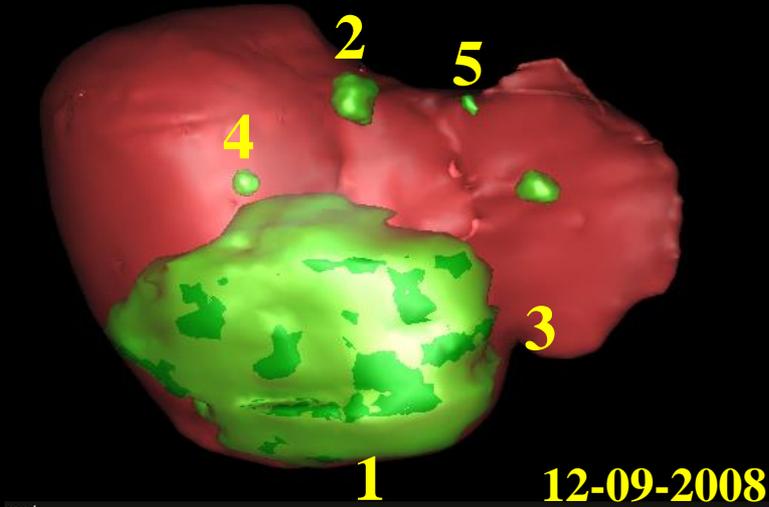

Followup 1 Followup 2 Followup 3

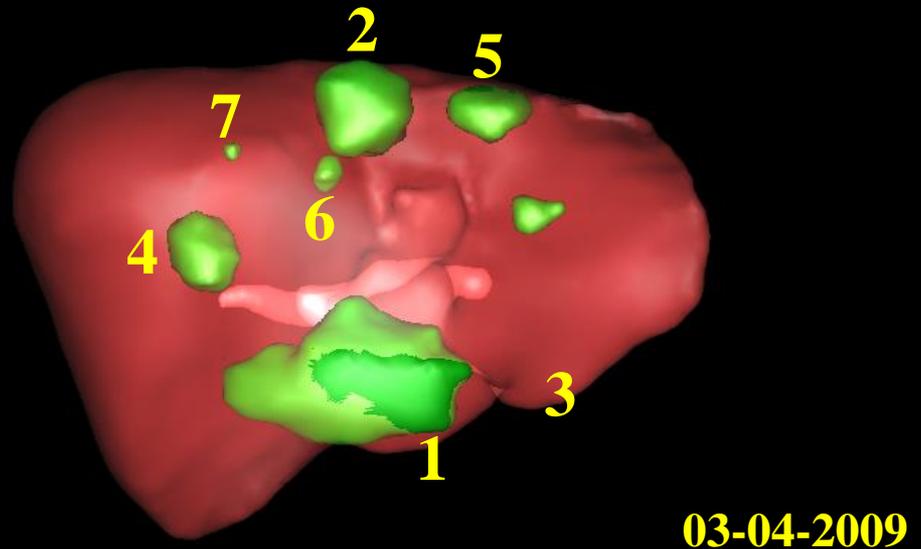

RECIST 1.1	Baseline	Followup 1	Followup 2	Followup 3
	2010-05-05 17:46:22 +0200	2010-07-13 13:47:04 +0200	2010-09-01 12:37:47 +0200	2010-10-21 12:24:01 +0200
RECIST absolut	119.51 mm	86.18 mm	83.44 mm	100.91 mm
Difference to Baseline in %	---	-27.89	-30.18	-15.56
Target Lesion 1	59.31 mm	45.51 mm	42.30 mm	46.63 mm
Target Lesion 2	14.41 mm	13.73 mm	11.61 mm	13.27 mm
Target Lesion 3	27.63 mm	17.27 mm	22.77 mm	36.21 mm
Target Lesion 4	18.16 mm	9.68 mm	6.77 mm	4.80 mm
Non-Target Lesion 1				28.28 mm
Non-Target Lesion 2				28.84 mm

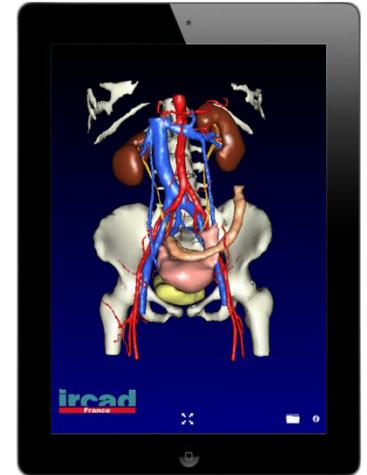

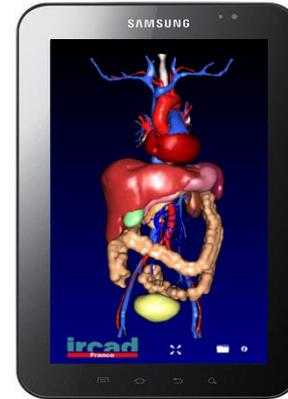

4D :Planning from 3D patient map

DISCOVER WEBSURG

The surgical reference worldwide

Visit the No. 1 international e-learning website offering free-of-charge educational content in all fields of minimally-invasive surgery provided by world-renowned experts.

All content meets standards on the Net Foundation (FOUCode) standards which guarantees quality and reliability.

Follow our 281000 registered members, join the wBSurg community right now!

Subscribe now, it's free and free unattended access!

Log in anytime, anywhere

Access the website using any resolution parameters and/or any environment (PC, tablet, smartphone...)

Multiple specialties in multilingual content

All the scientific content is translated into 6 languages.

10 surgical specialties:

- General and digestive surgery (colorectal, bariatric surgery, ...), Endocrine surgery, Plastic surgery, Thoracic surgery, Urology, Gynecology
- Cardiovascular surgery, Endoscopic surgery (Gastroenterology)
- Neurosurgery - ENT - Skull base, Arthroscopy and Upper-Limb Surgery

4 technology-related specialties:

- Natural Orifice Transluminal Endoscopic Surgery (NOTES), Robotic surgery, Equipment, Single port surgery.

The First Virtual Library

Watch streaming videos free of charge.

- more than 1,200 surgical videos (2D-4D videos)
- more than 300 lectures
- more than 100 operative technique chapter presentations
- 700 expert interviews and debates
- clinical cases

A comprehensive and interactive content

All videos are:

1. supplemented with an abstract and classified according to fields of interest
2. available in English
3. translated and available in several languages (English, French, Spanish, Chinese)

Give your opinion:

4. Organize your favorite videos
5. Comment the video and discuss it with members
6. Ask your questions to experts

**Tracking &
Augmented reality**

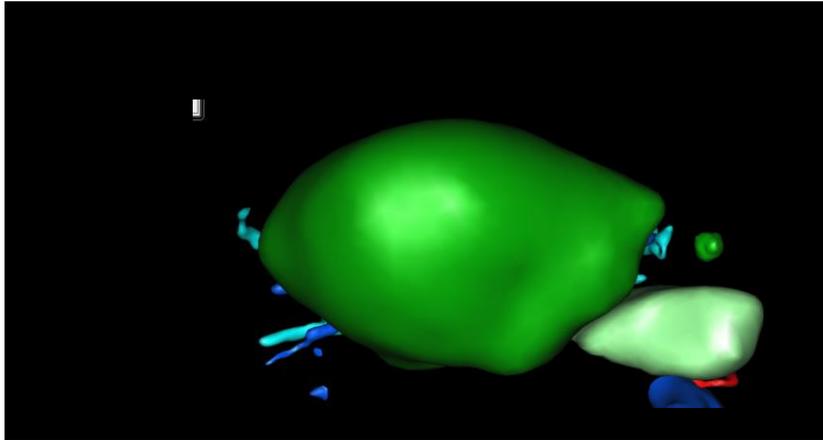

Augmented Reality Assisted Surgery

Current Available Systems for liver

- CAScination : Optical tracking & Rigid registration
- PathFinder : Optical tracking & Rigid registration

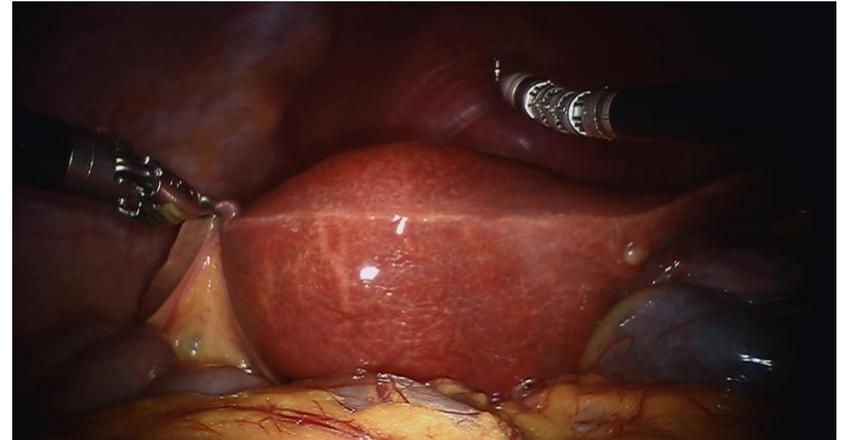

**These systems are not Augmented Reality
But Augmented Virtuality !!!**

What do we call “Augmented Reality”?

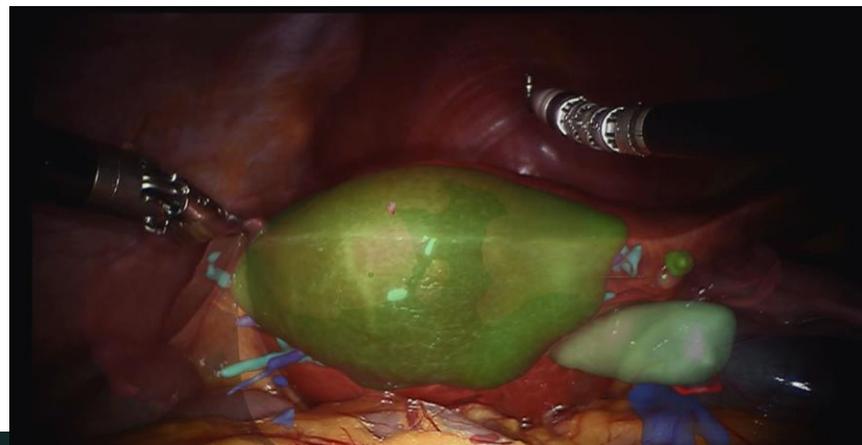

3D virtual Image

+

Video Image

= Augmented Reality

Augmented Reality Components

1: Virtual 3D images

2. AR Visualisation System

3. Registration

4. Tracking

Augmented Reality Components

1: Definition of virtual data

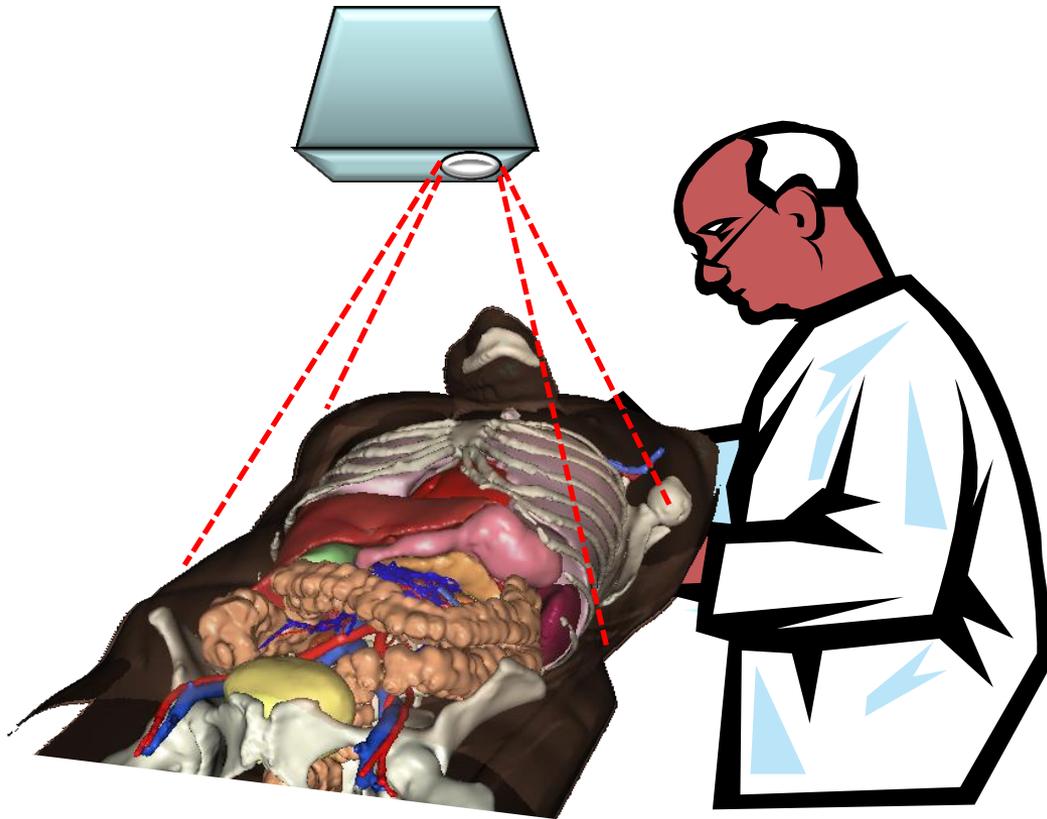

2. AR Visualisation Systems

3. Registration

4. Tracking

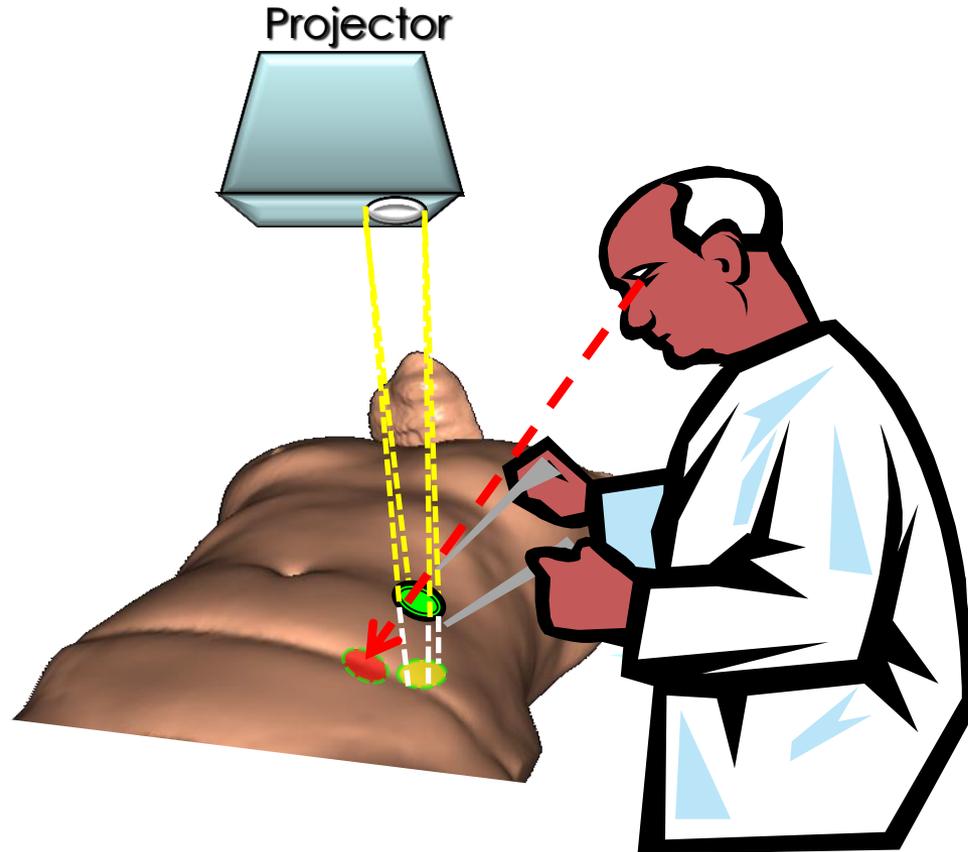

Augmented Reality Visualisation systems

Projection

Dr. Maki Sugimoto with Osirix (opensource software running only on MacOs)

WARNING : MAJOR ERROR of the Projection

WARNING : MAJOR ERROR of the Projection

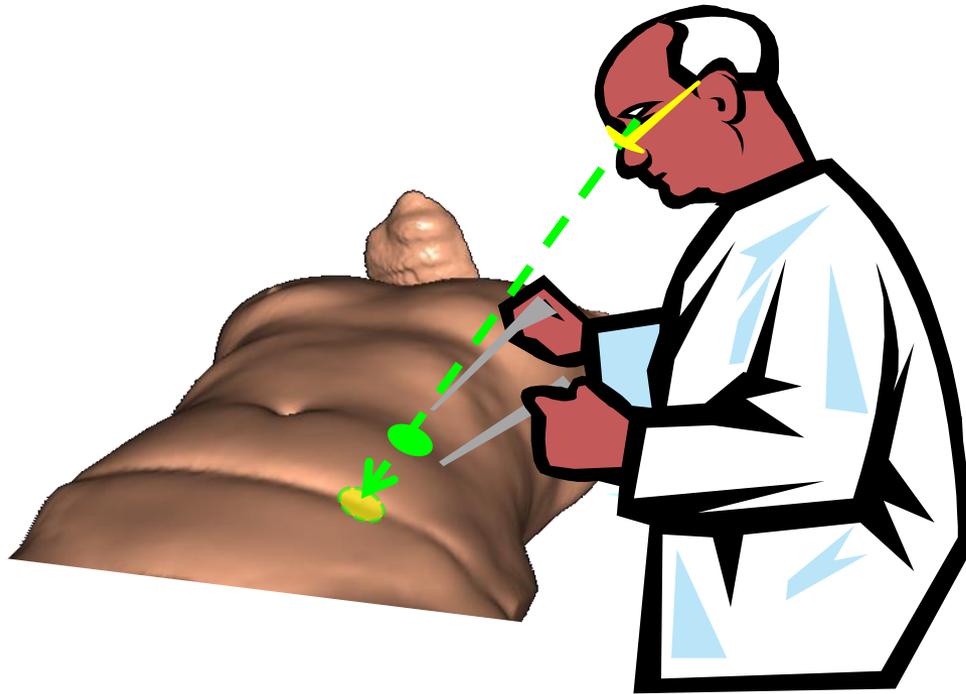

Should be used only for underskin structures

IRCAD Taiwan : Spinal surgery

Fast positioning of the C-Arm for Needle placement

WARNING : MAJOR ERROR of the Projection

Augmented Reality Visualisation systems

See-Through Glasses: More & more solutions

Lumus

Epson

Optinvent

scalar

Google

Brother

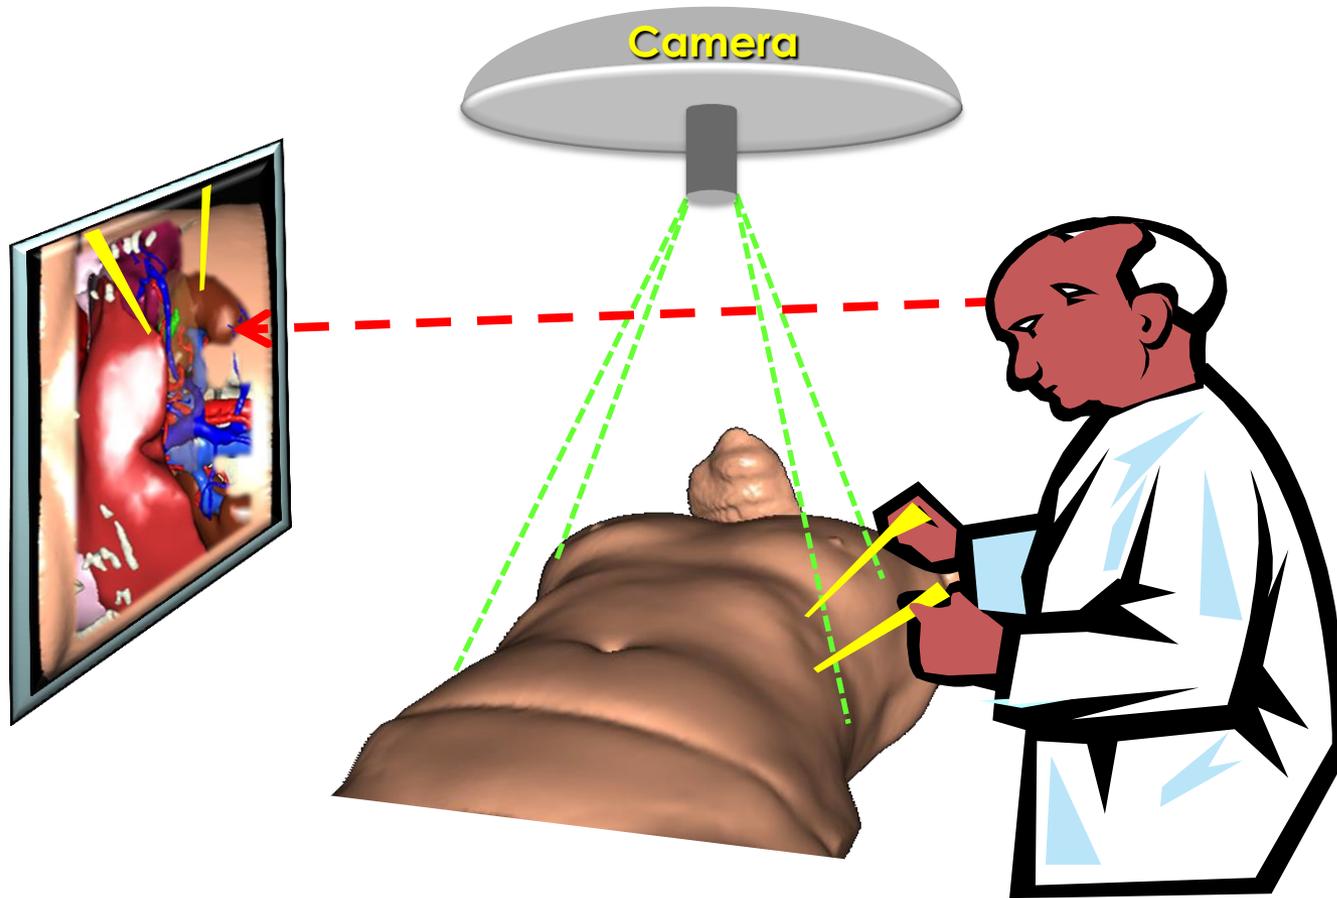

Vuzix

Laster Technology

Augmented Reality Visualisation systems

Augmented Reality Visualisation systems

Best solution for MIS : Usual surgical screen

Augmented Reality Components

1: Definition of virtual data

2. Augmented Reality Visualisation

3. Registration

4. Tracking

IRCAD Interactive Augmented Reality

Interactive Registration

Use of underskin landmarks (published in Jama 2004)

Interactive Registration

Hepatic surgery

Pancreatic Surgery

Parathyroid Surgery

Interactive Registration

Conclusion

More than 50 Surgical Procedure

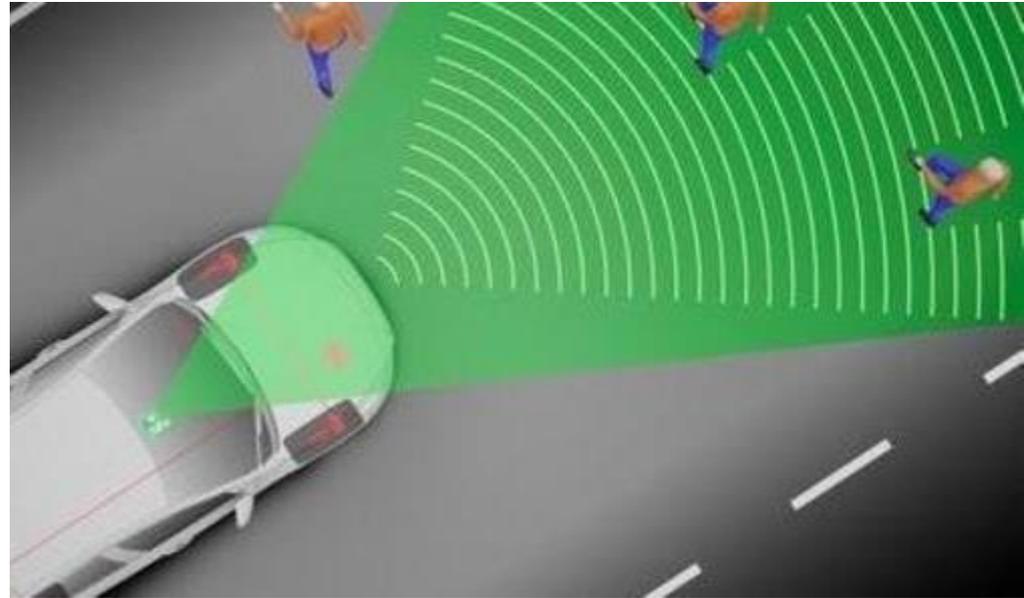

→ Highly Efficient with Good accuracy

→ **BUT** fully user dependent

→ Require specific training in 3D manipulation

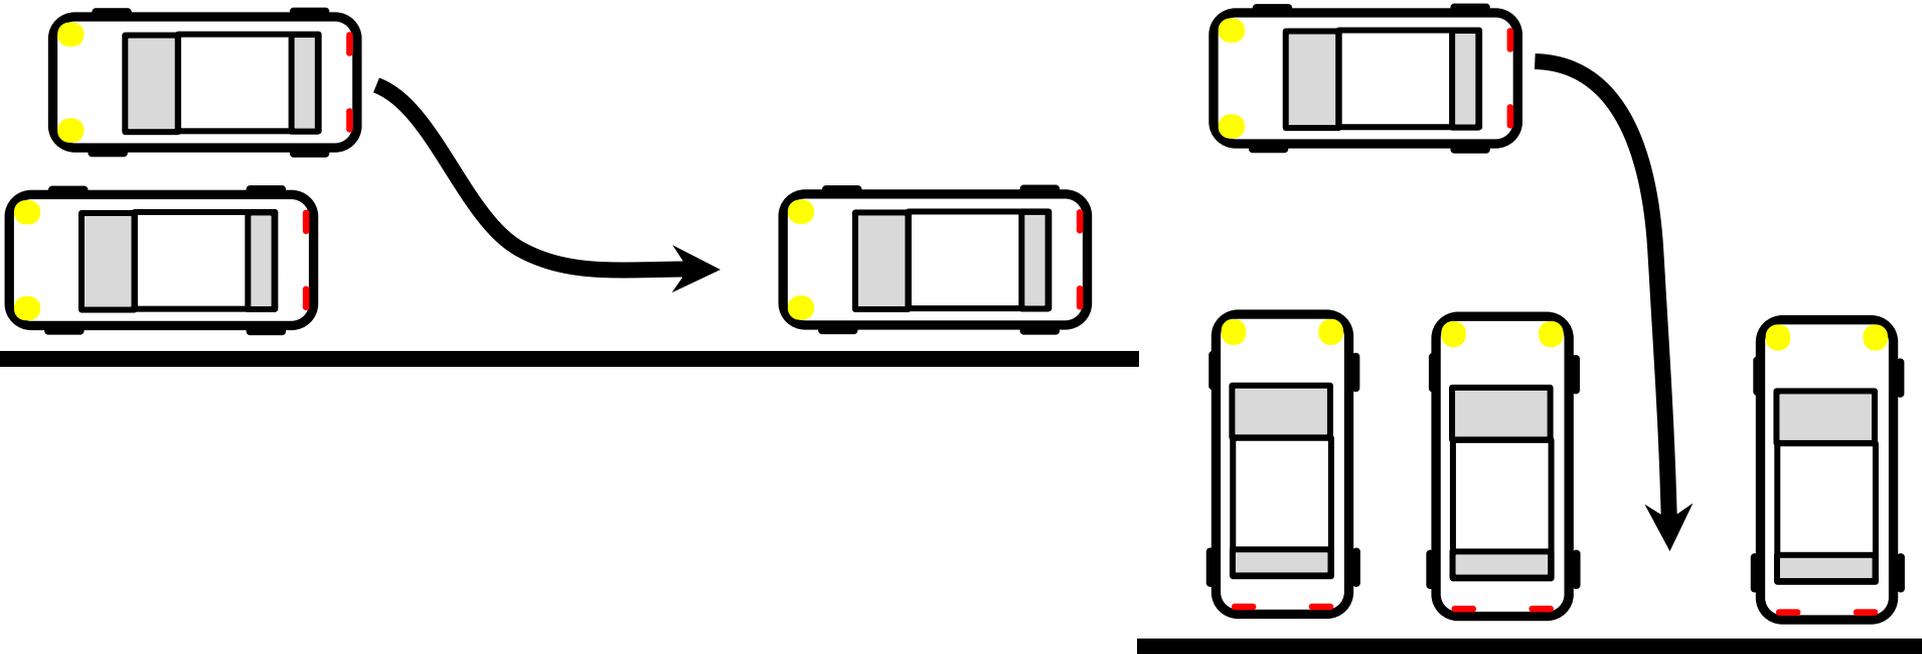

→ Only rigid registration

Add automation through signal analysis

Environment & Movement Tracking

Exemple : Parking AR Assistance

**AR Assistance will be linked
to the configuration → Not 1 solution**

Application to Surgery

1: It is mandatory to understand the **Surgical Workflow** of the procedure

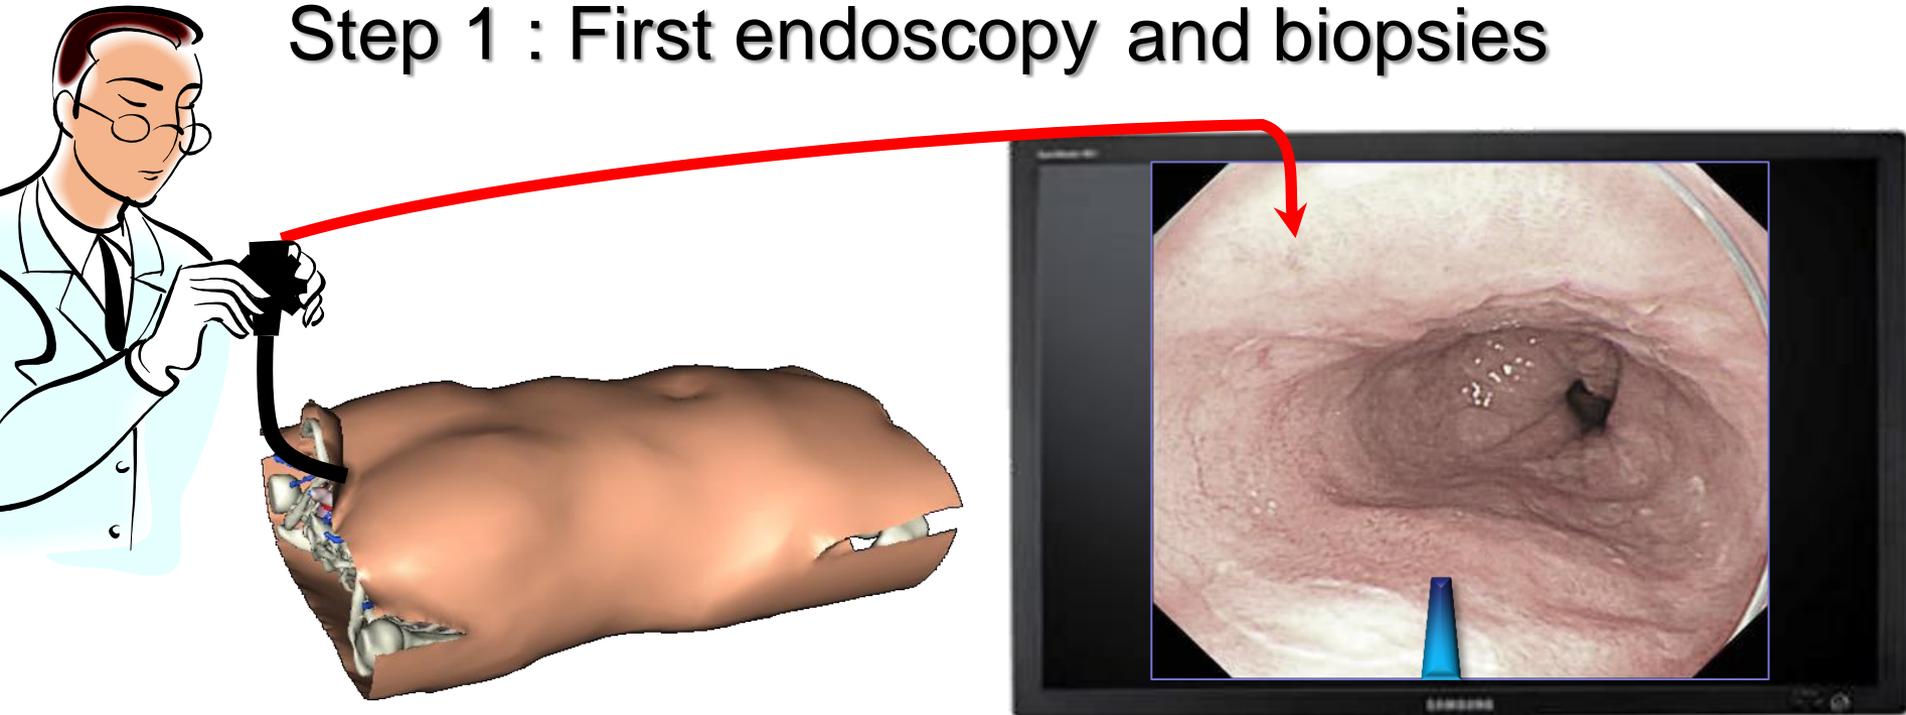

2: It is mandatory to develop **specific AR** assistance from this workflow

→ Several procedure = several solution
Each Step needs its own adapted solution

Exemple 1 : Gastroenterology

The Surgical Workflow of the procedure

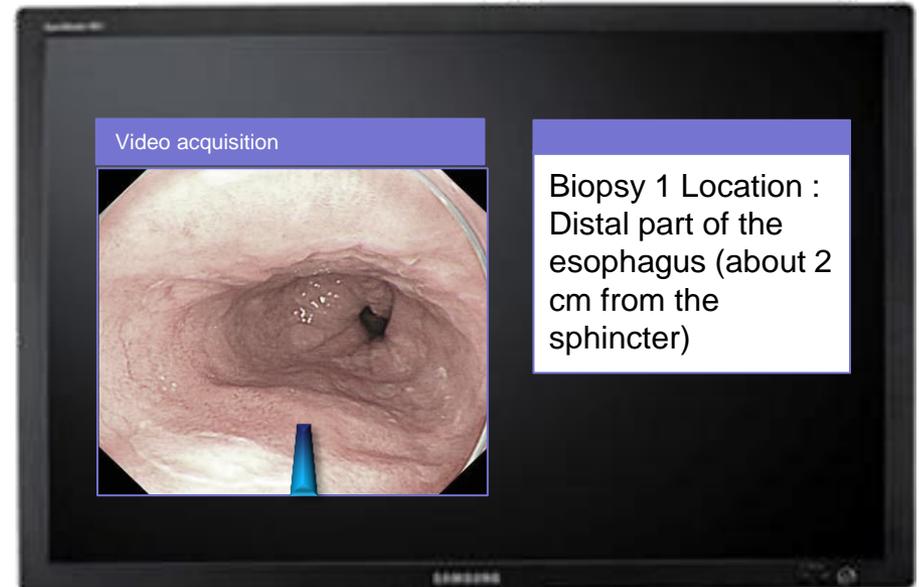

Step 1 : First endoscopy and biopsies

Exemple 1 : Gastroenterology

The Surgical Workflow of the procedure

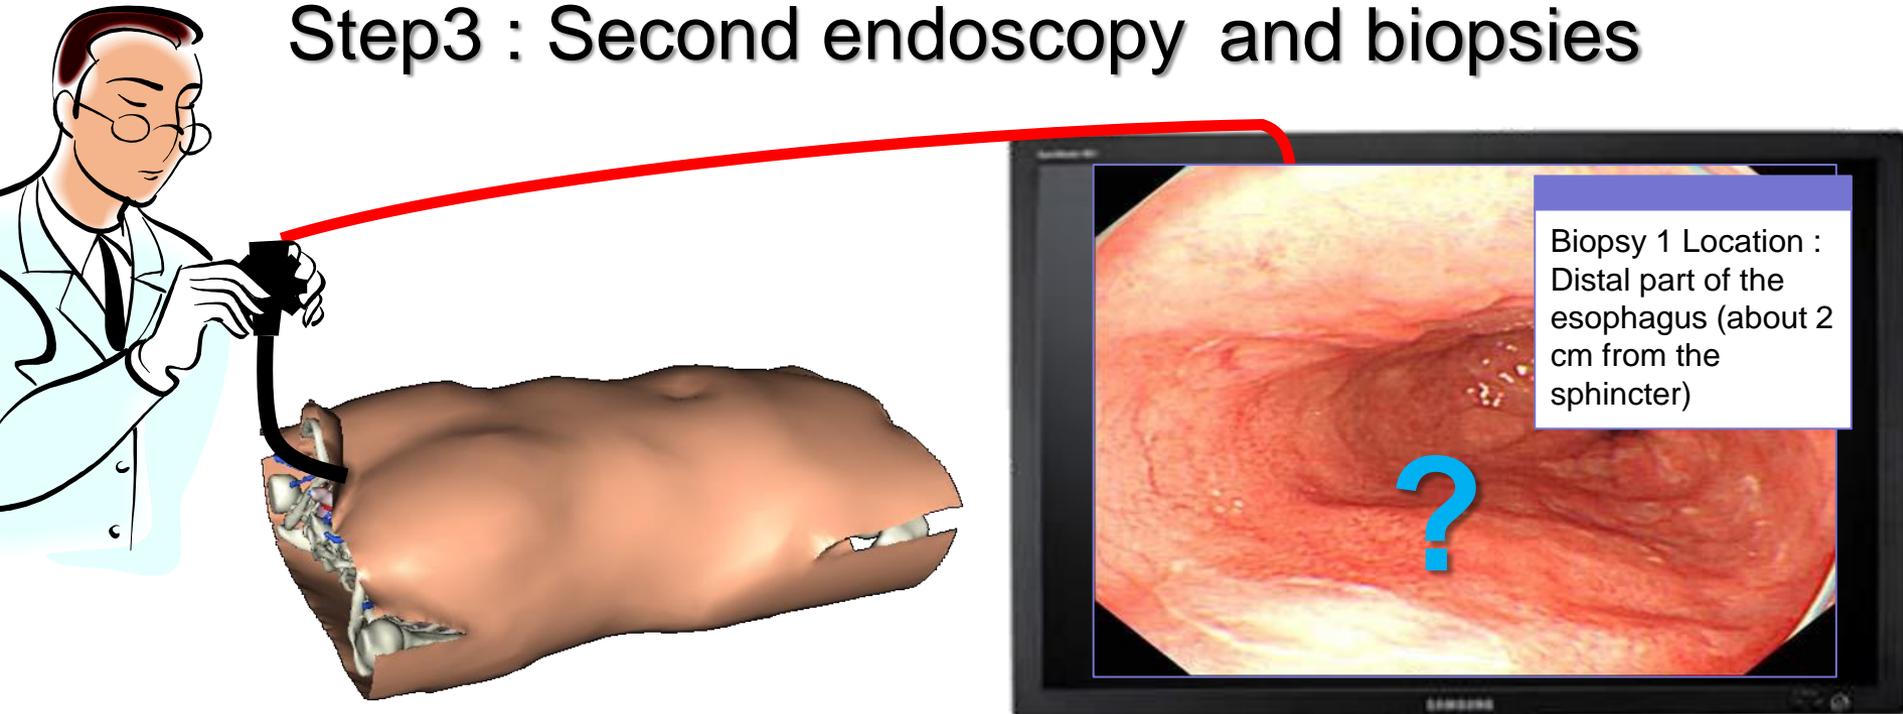

Step 2 : Post analysis and report

Exemple 1 : Gastroenterology

The Surgical Workflow of the procedure

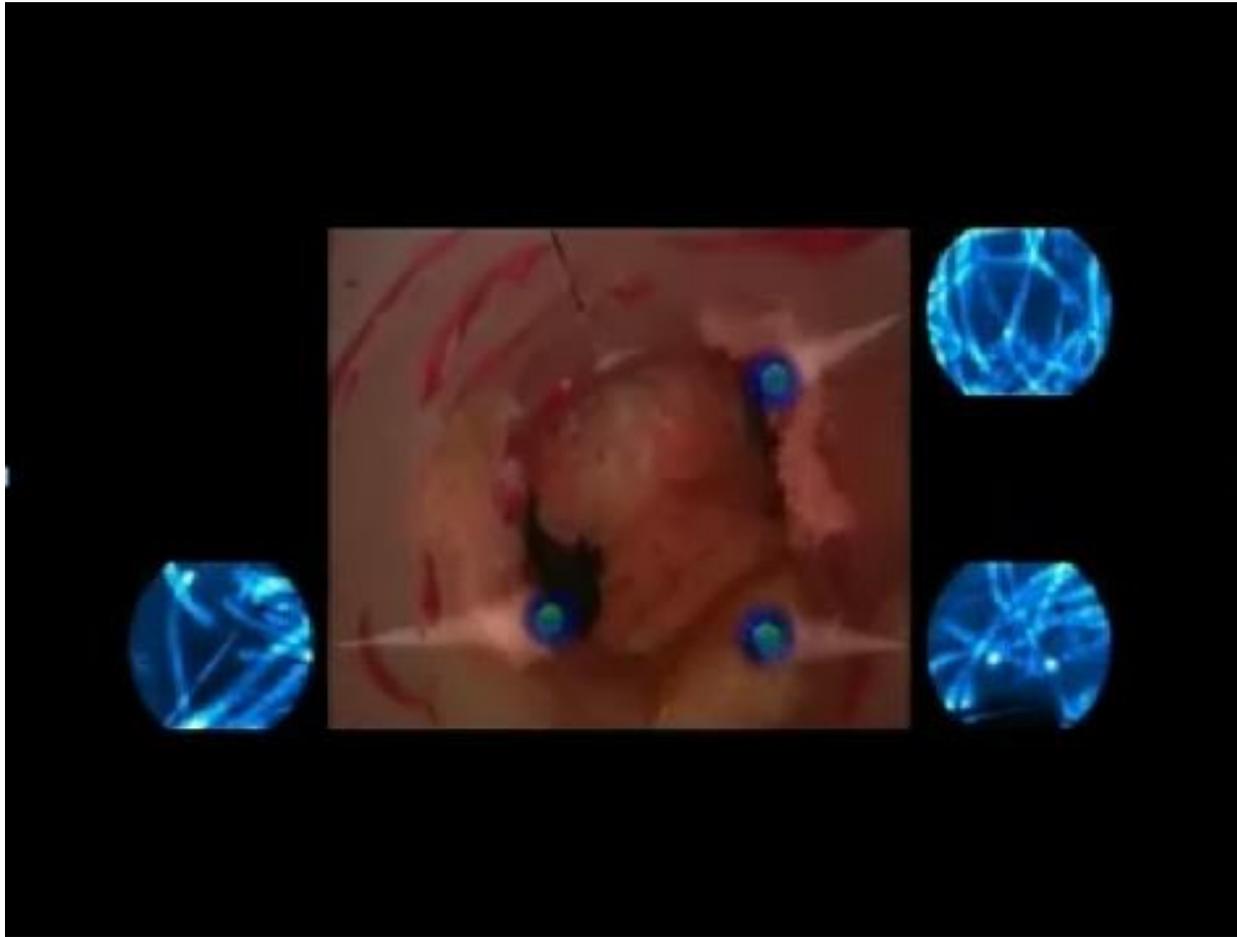

Step3 : Second endoscopy and biopsies

Where was the biopsy ?

Solution 1 : Gastroenterology

Feature tracking : Pete Mountney (ICL/Siemens)

MaunaKea Technology Confocal virtual biopsy

Solution 1 : Gastroenterology

Feature tracking **Benefit** :

No need of new device but a computer

MAIN LIMITS :

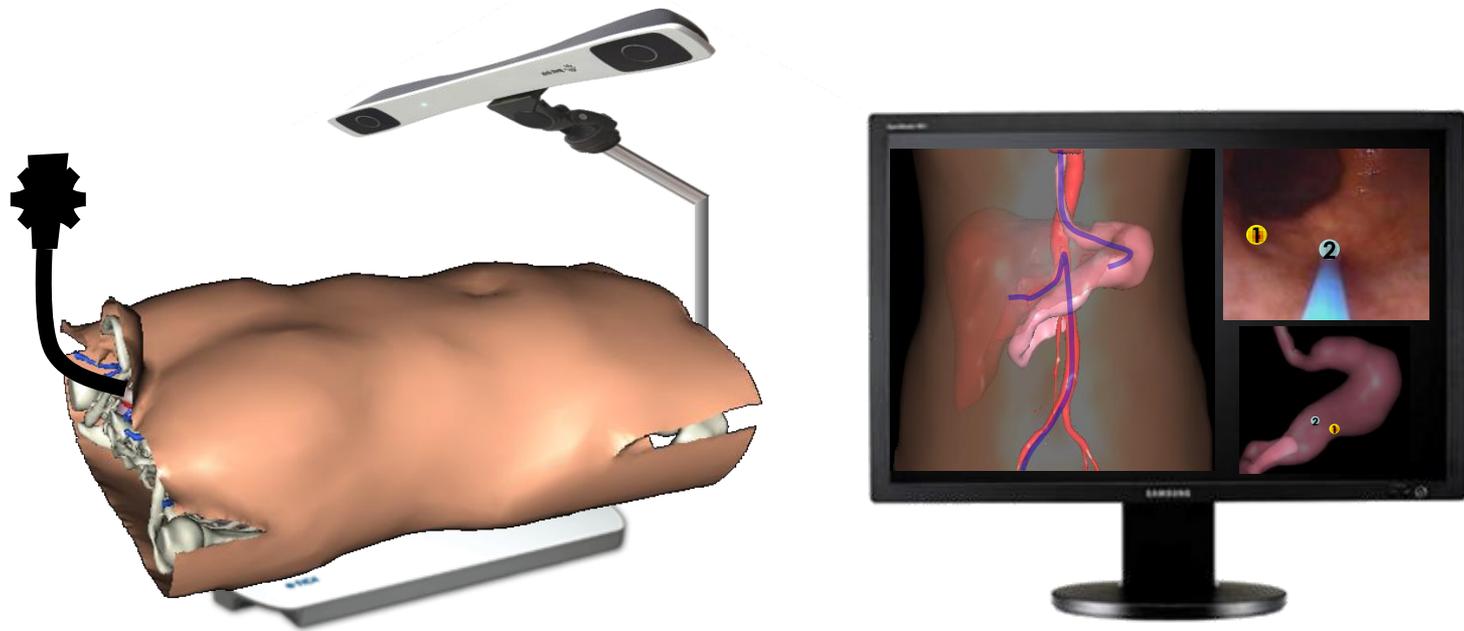

1: Should not work if lesion evolution

2: Complex to assume for CE-Mark of FDA

➔ Long time to market

Solution 2 : Gastroenterology

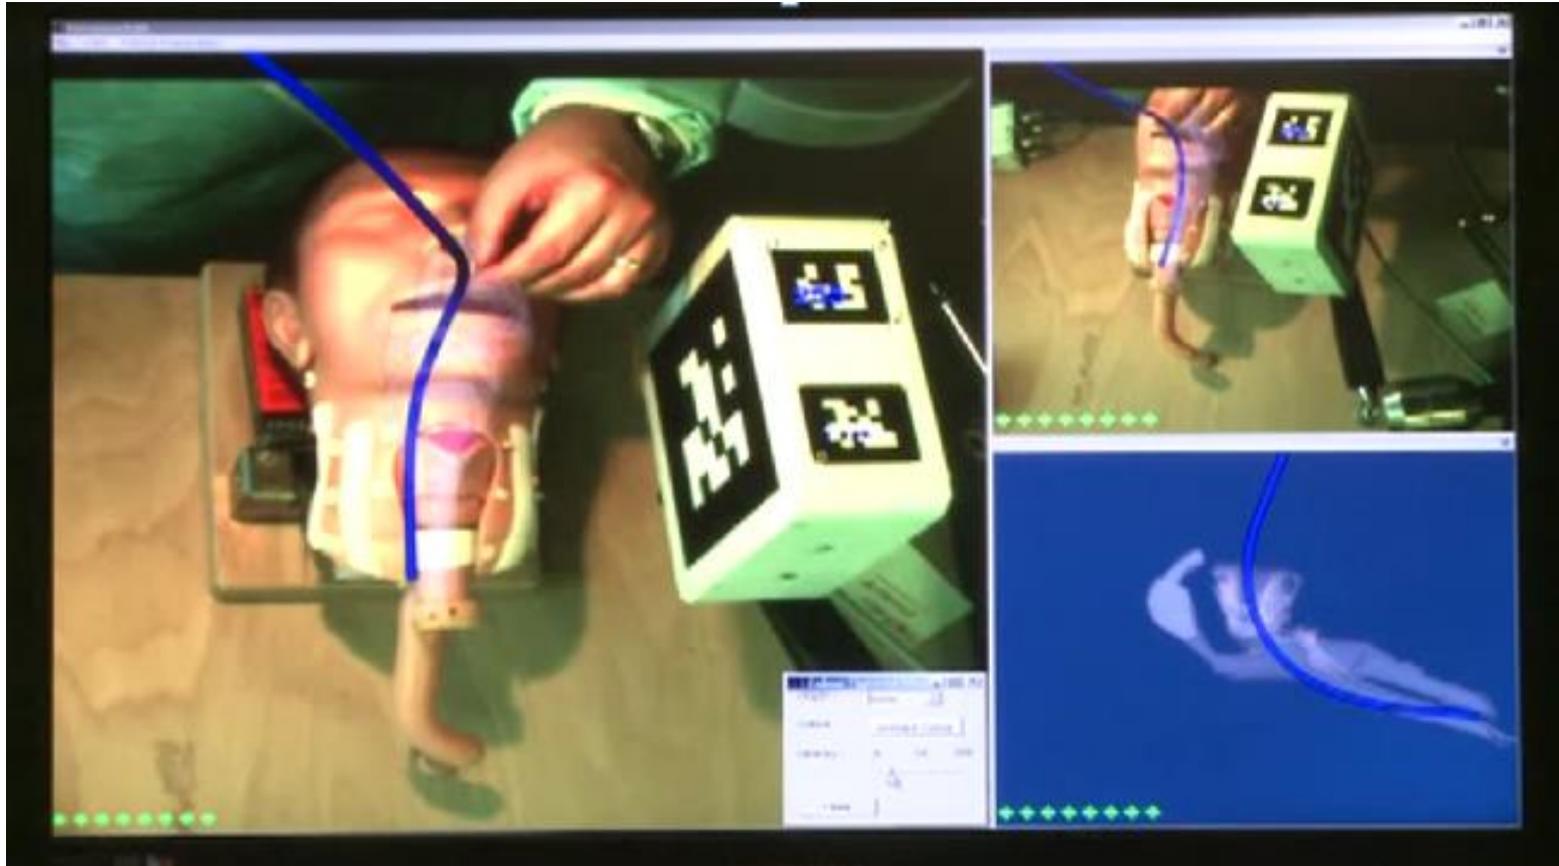

3D Localization of the endoscope or of a catheter in the patient with Augmented Reality information for surgeon Guidance

Aurora 5/6DOF Shape Tool ©NDI – IRCAD Design

Solution 2 : Gastroenterology

➔ Electro-magnetic tracking

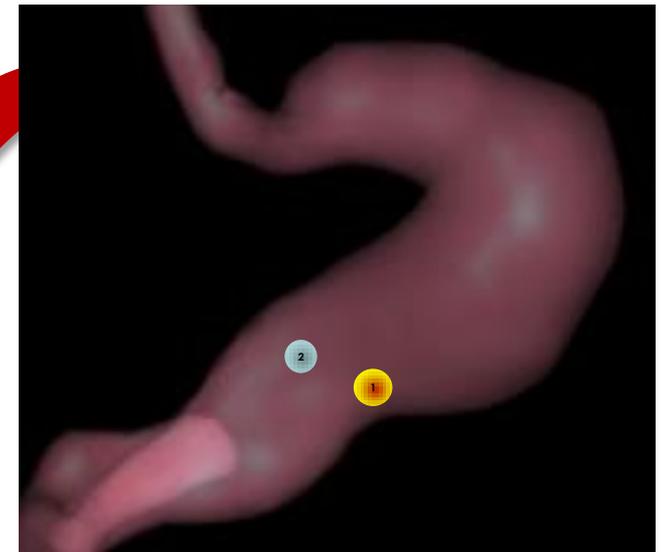

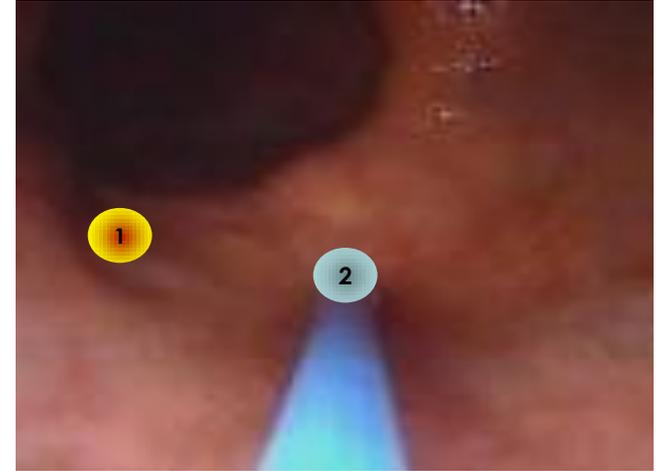

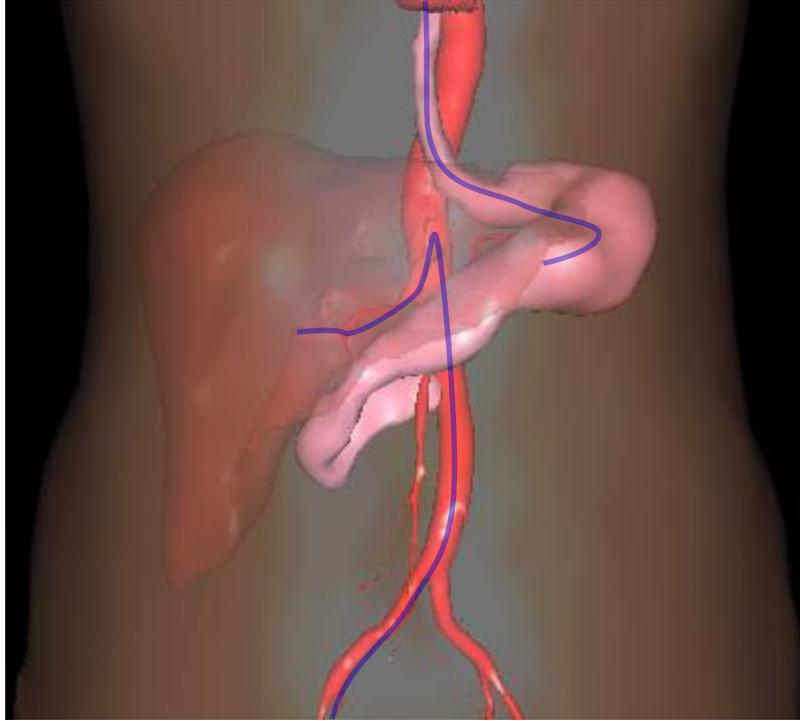

METRIS : US Patent 12/797209 – Karl Storz + IRCAD

Solution 2 : Gastroenterology

*Augmented Reality for NOTES : METRIS
Nicolau et al., Surgical Oncology 2011*

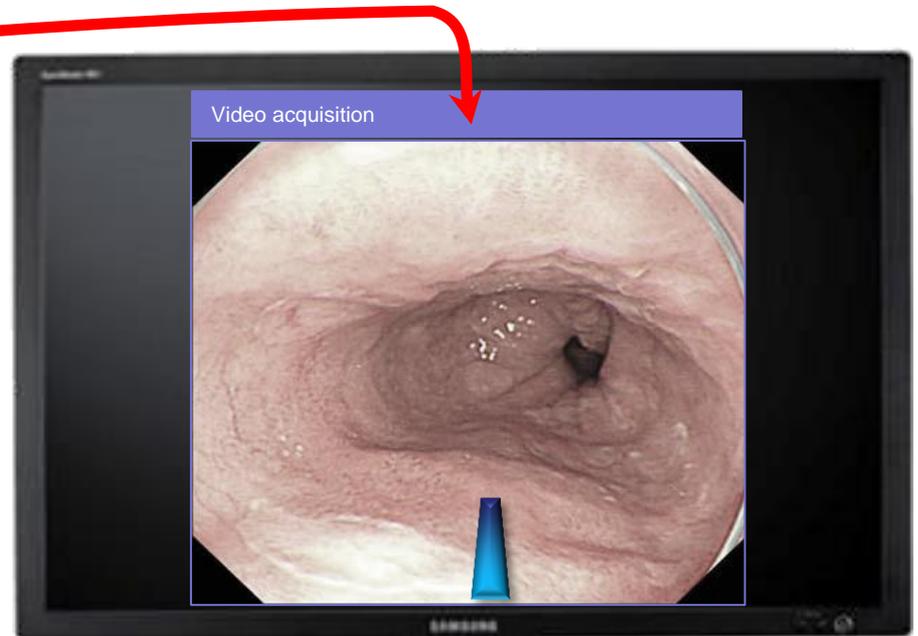

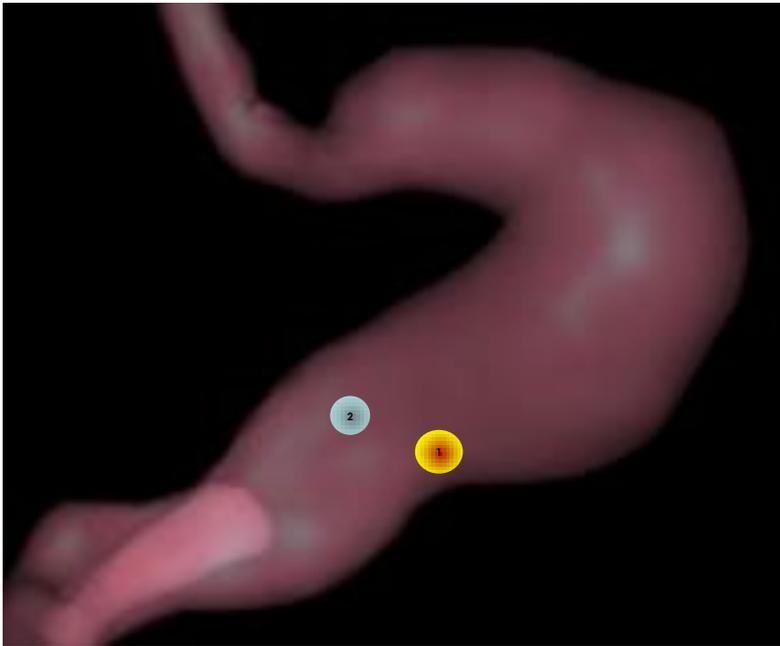

Solution 2 : Gastroenterology

Main Limits :
Need Medical image &
Patient Modelling

Solution 2 : Gastroenterology

Routine Reality: No preoperative image
Pathologies not visible in such images

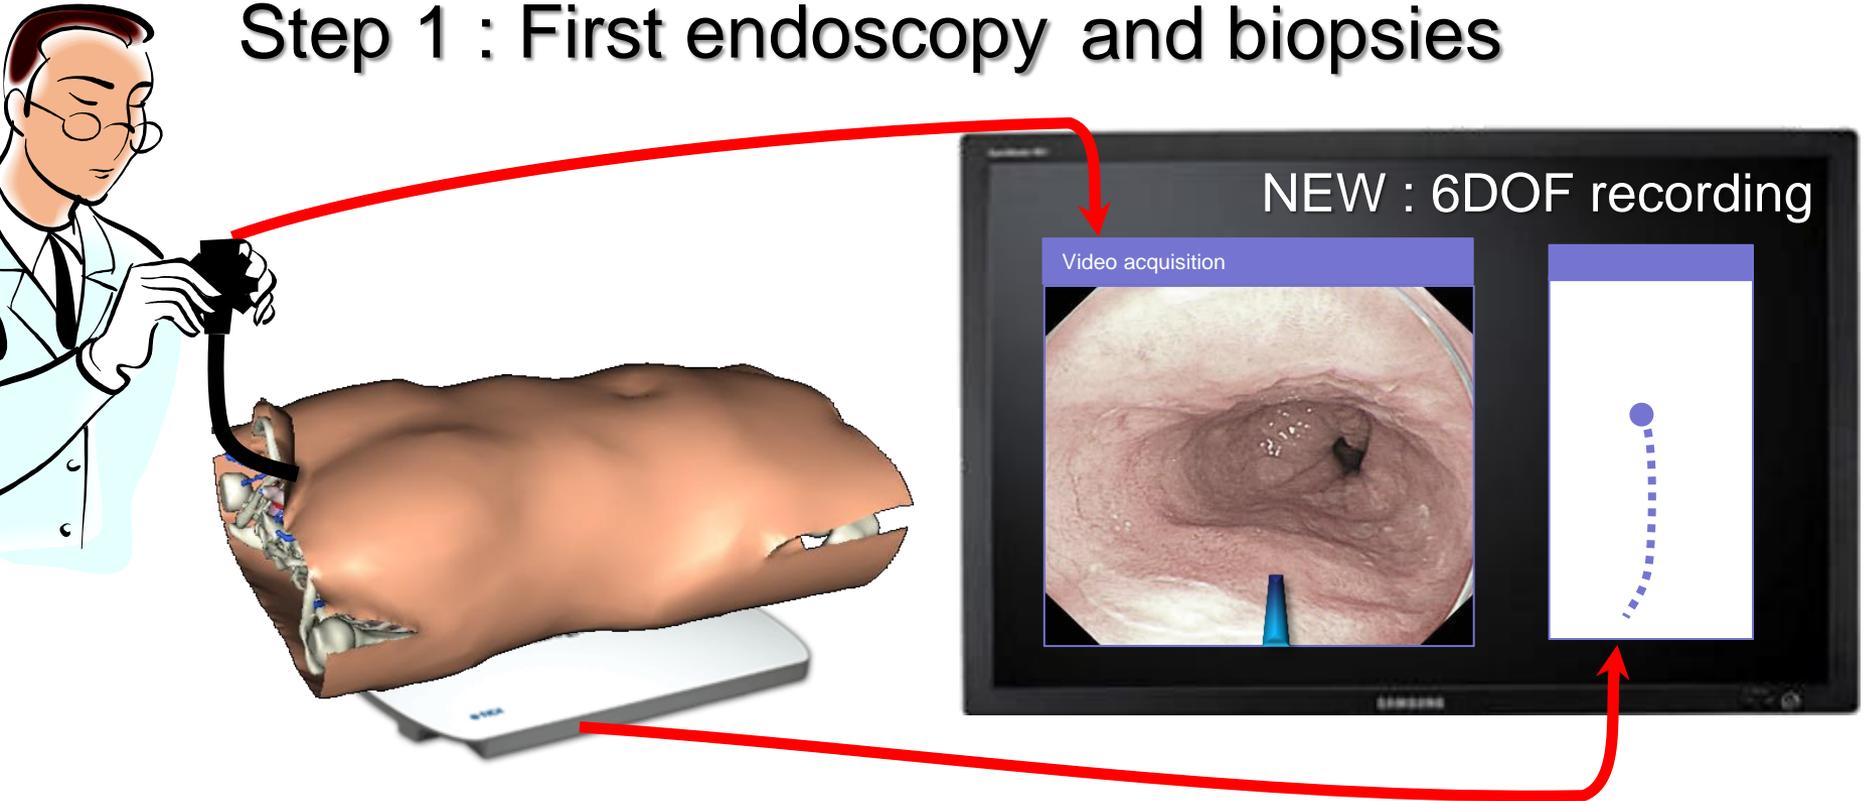

Not compatible with the Clinical Workflow

Solution 3: Gastroenterology

6 DOF Electro-magnetic tracking

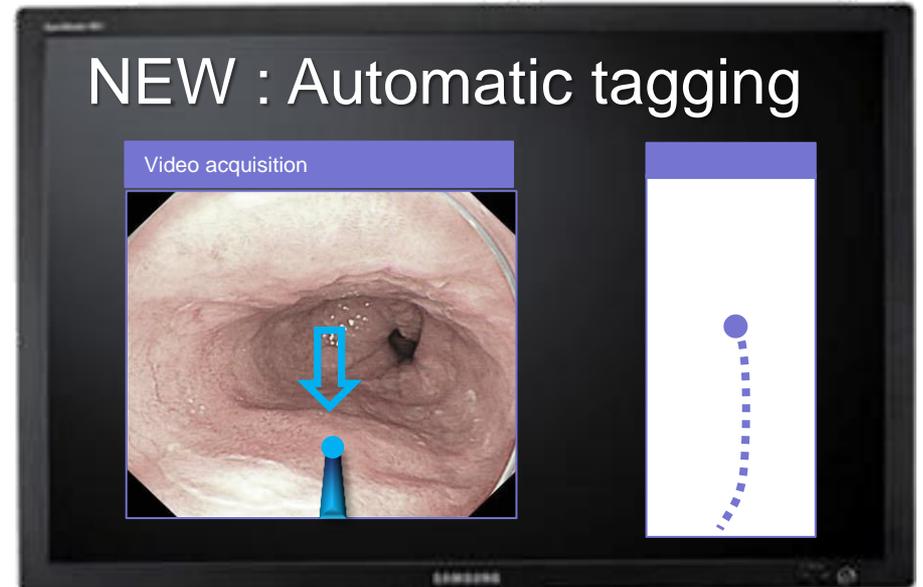

Step 1 : First endoscopy and biopsies

Solution 3: Gastroenterology

6 DOF Electro-magnetic tracking

Step 2 : Post analysis and tagging

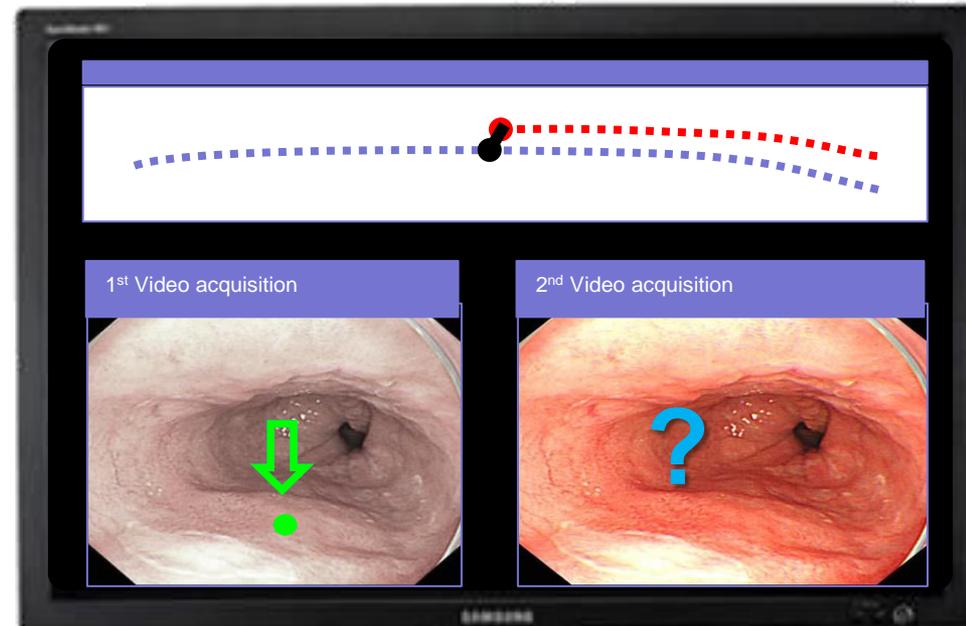

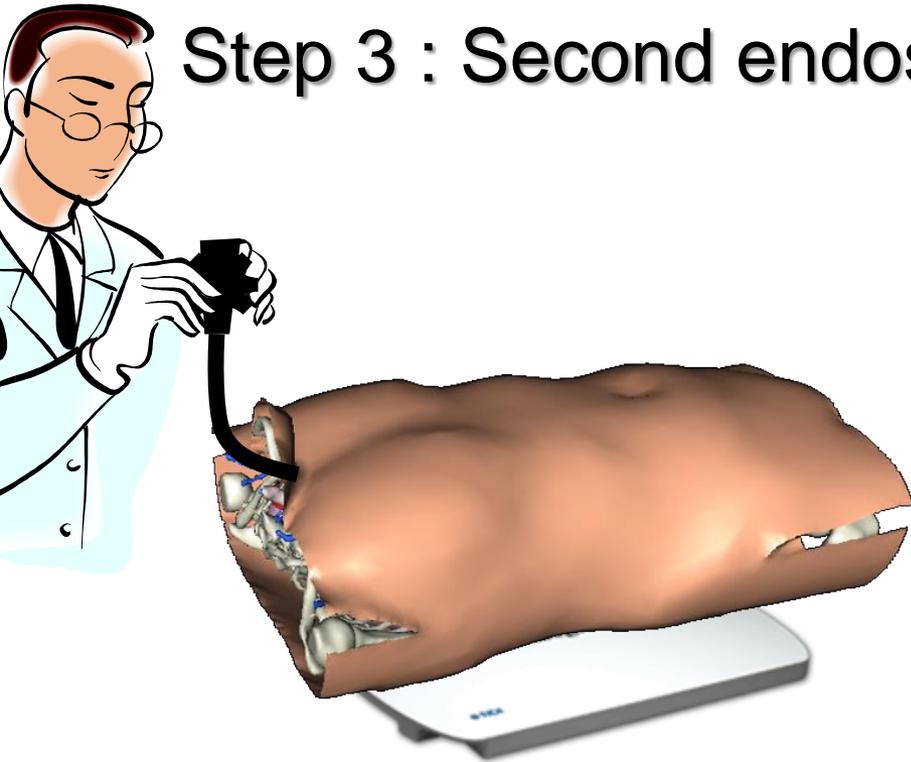

+ 6DOF location

Solution 3: Gastroenterology

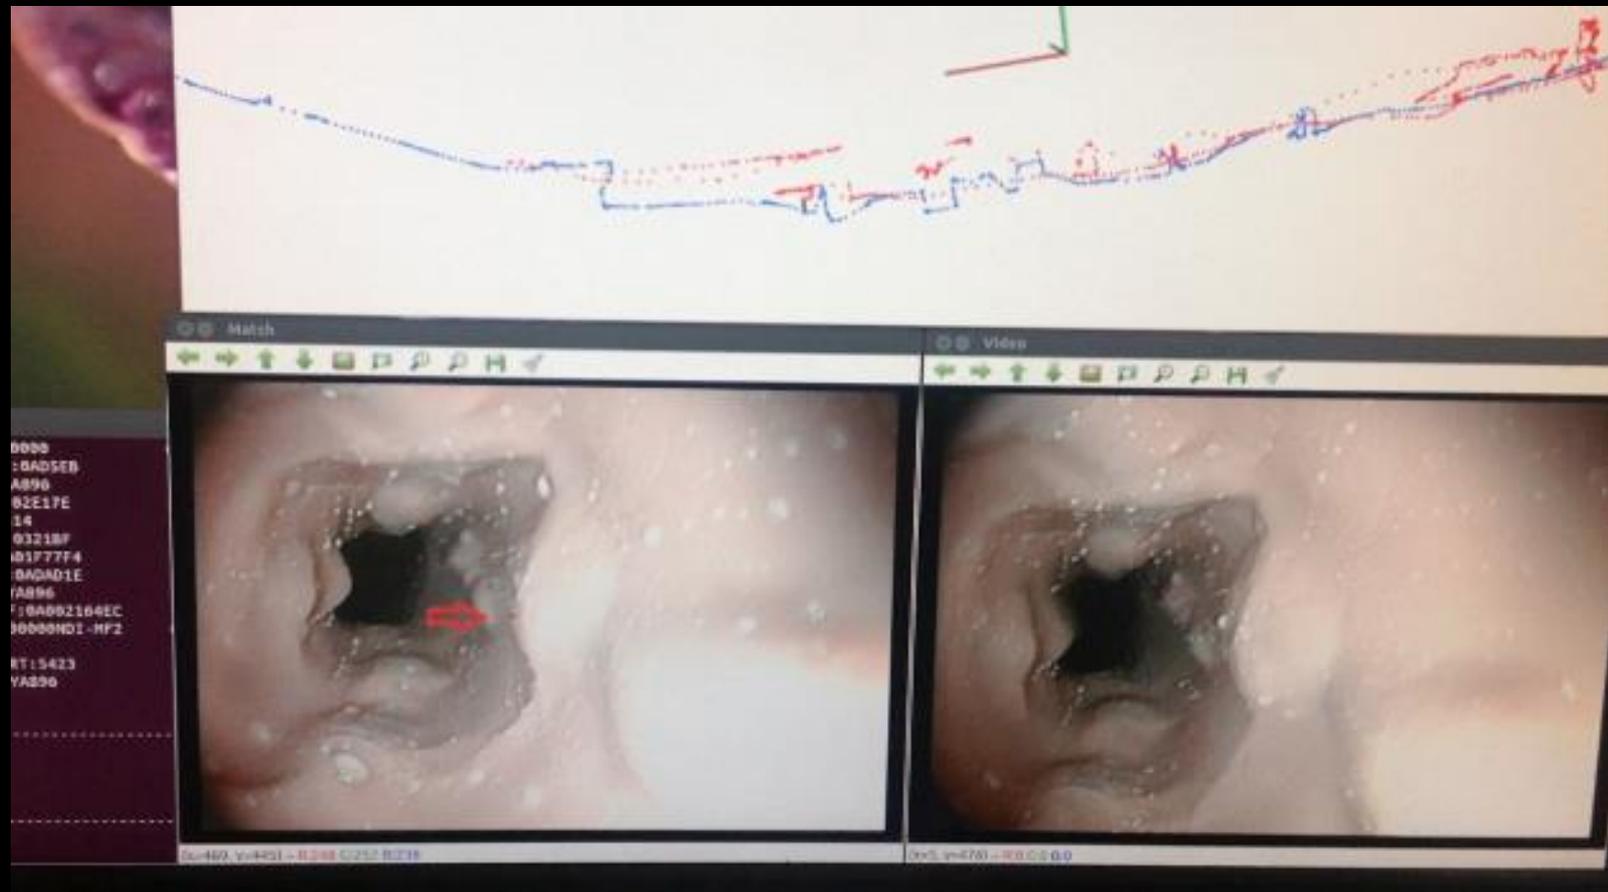

6 DOF Electro-magnetic tracking

Step 3 : Second endoscopy + **new synchronisation**

Solution 3: Gastroenterology

6 DOF Electro-magnetic tracking

First Endoscopy

Live Endoscopy

Exemple 2 : MIS Liver Surgery

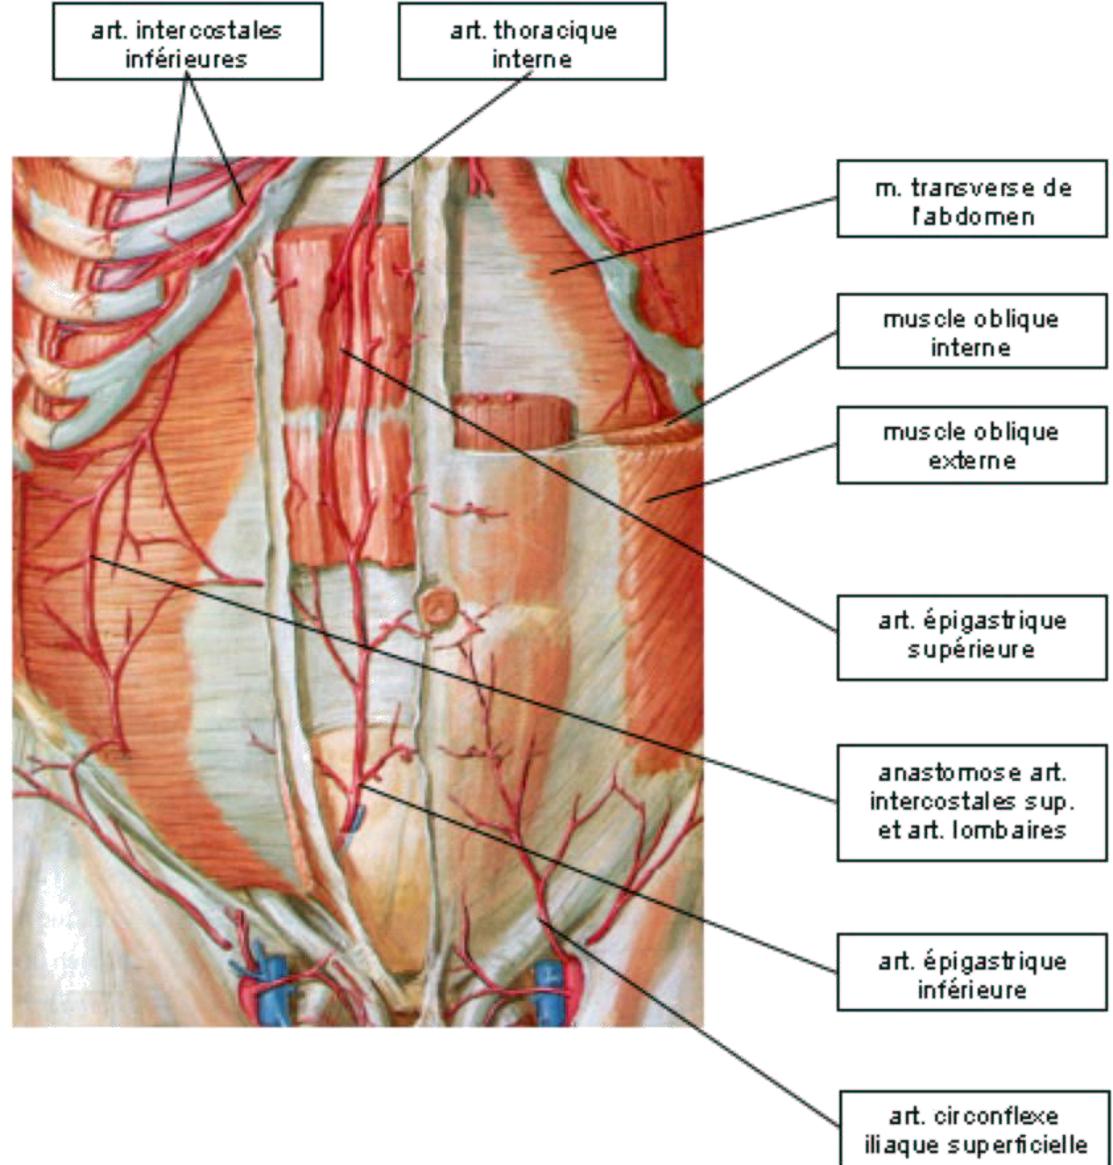

A Complex Workflow :

1. Veress Needle positioning
2. Pneumoperitoneum
3. Surgical Table Displacement
4. Trocart positioning
5. Laparoscopic Exploration
6. Removal of Liver attachment
7. Hile vessels control
8. Resection of the pathological liver
9. Endobag introduction and use
10. Resection of the skin for liver extraction
11. Liver extraction and skin suture

Step 1: Veres needle positionning

Risk 1 :
Epigastric
arteries
injury

Consequence:
Lost 5 to 15mn

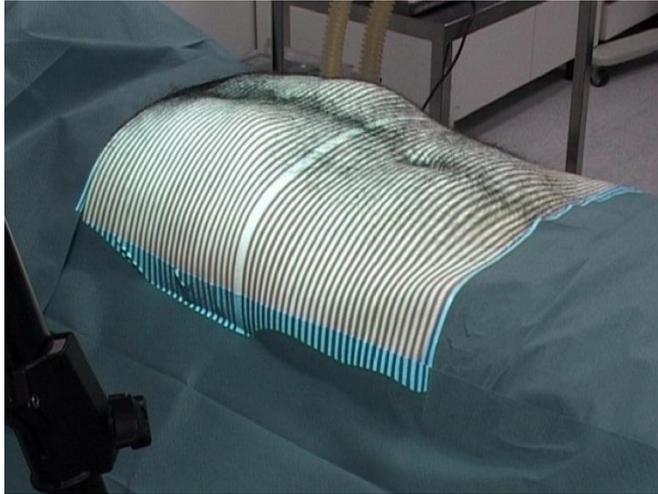

Step 1: Veres needle positioning

Risk 2 :

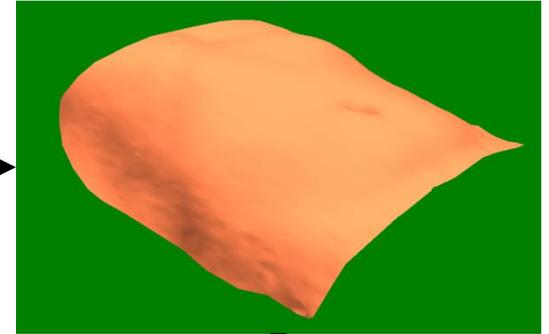

Liver, organs or abdominal vessels injury
+ Gaz insuflation in an organ

Consequence : conversion from MIS to open, can lead to the death of the patient

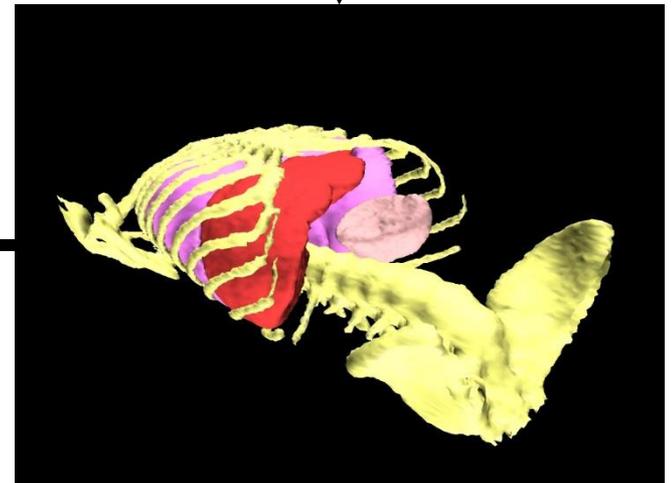

Step 1 : AR- Solution

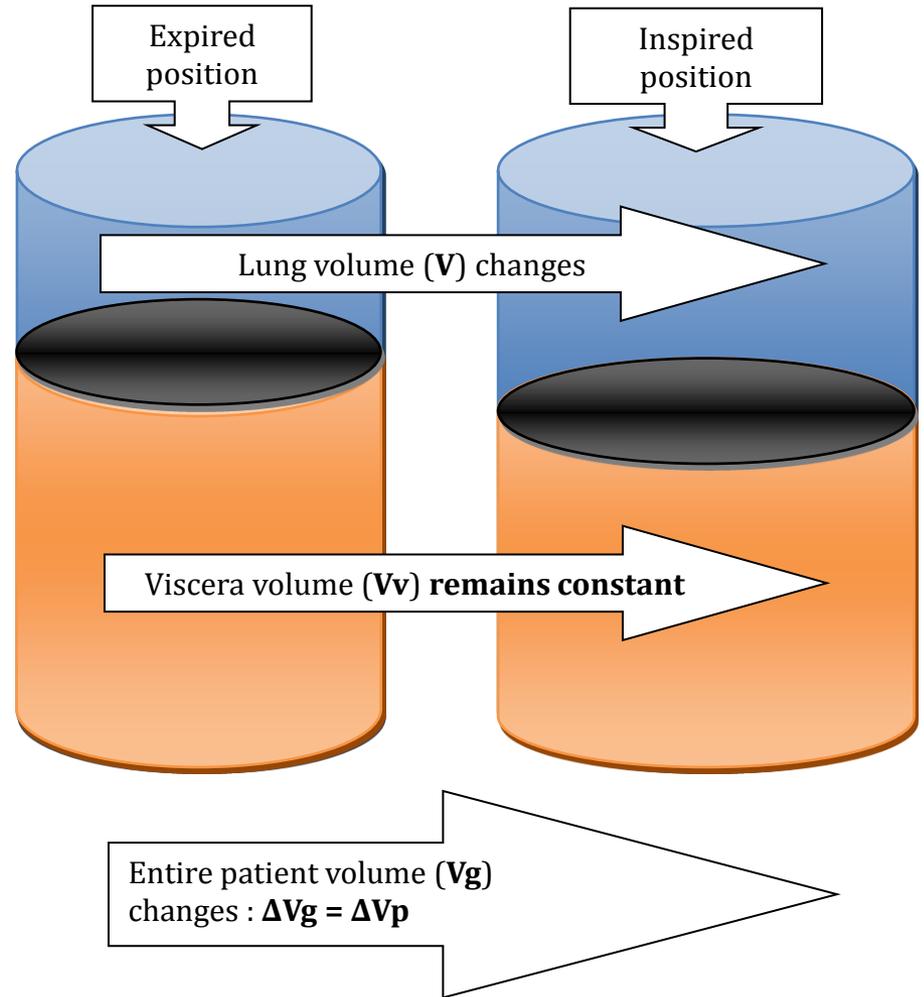

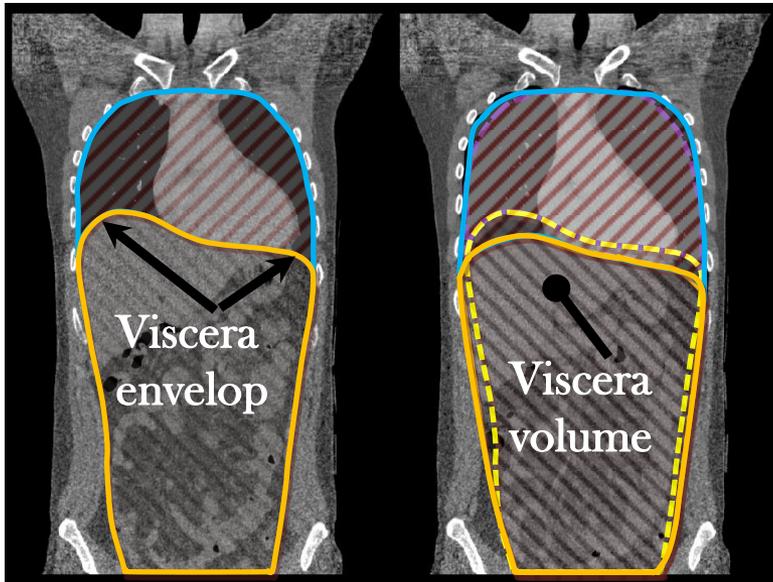

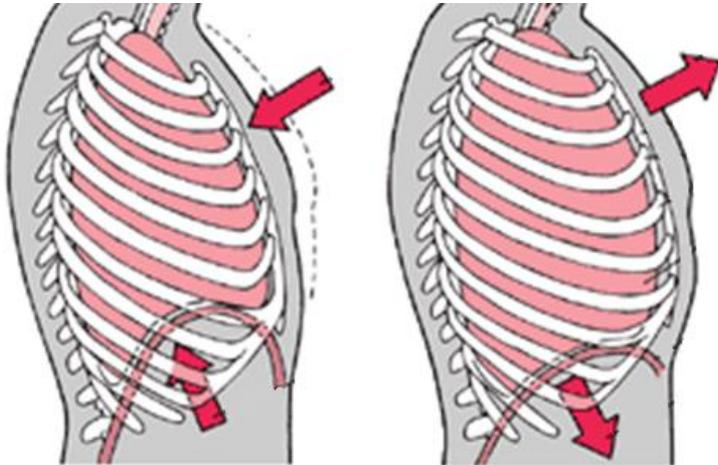

Automatic surface extraction

Automatic
Registration

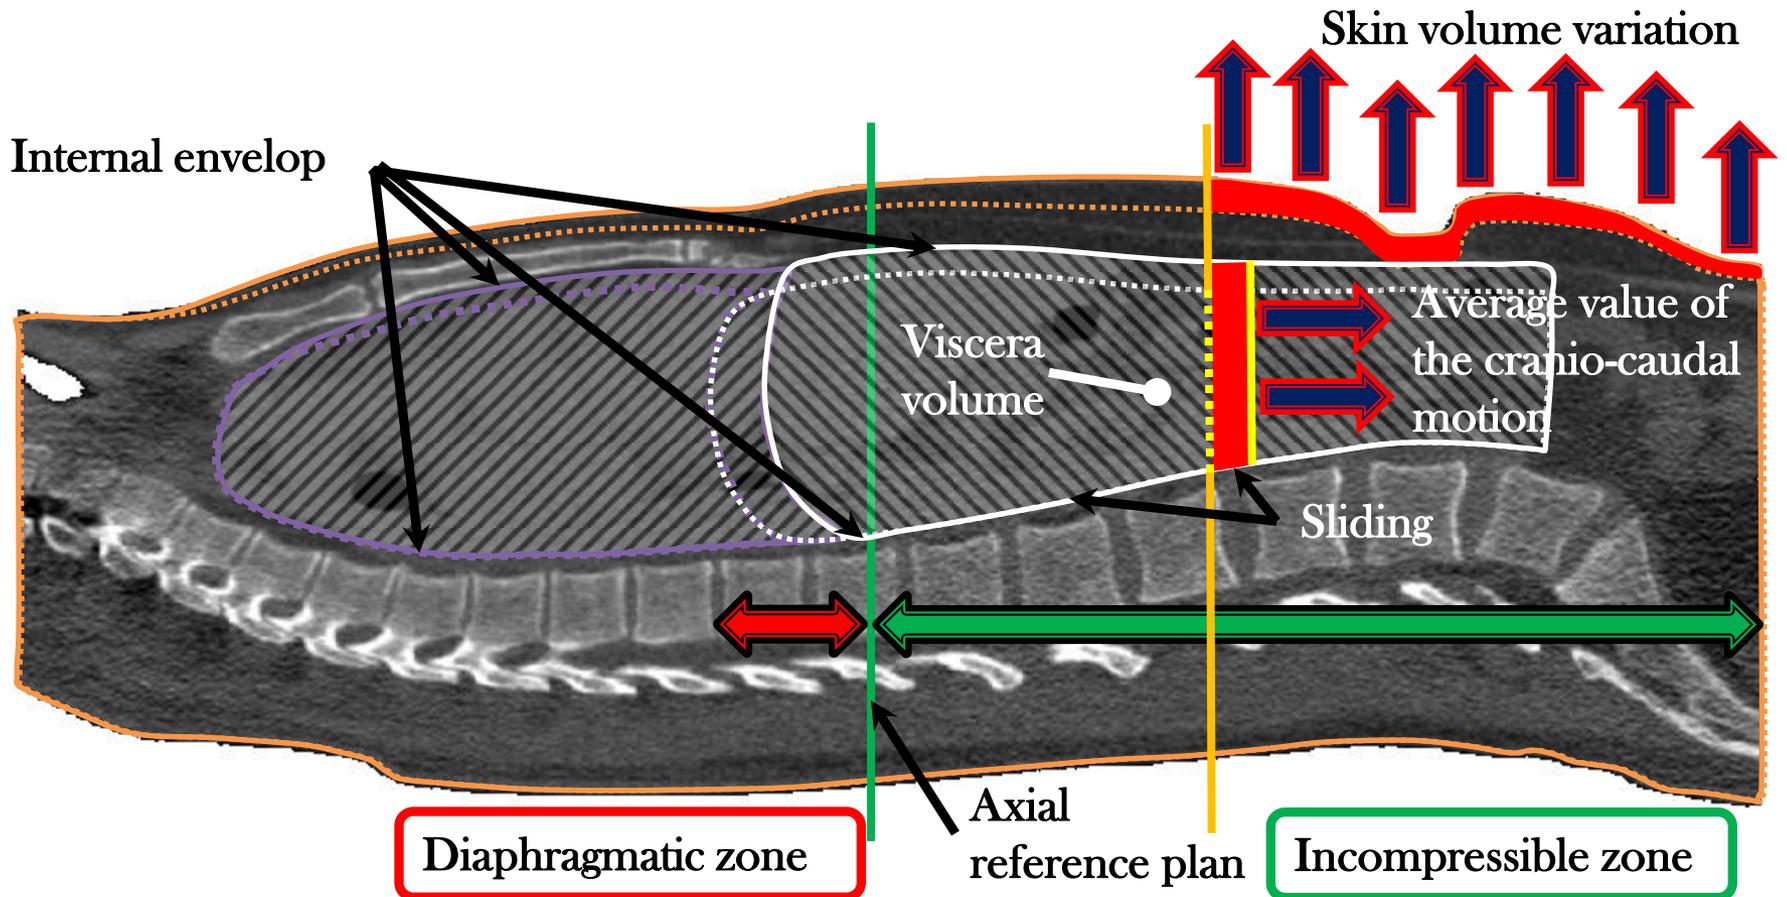

Breathing Analysis

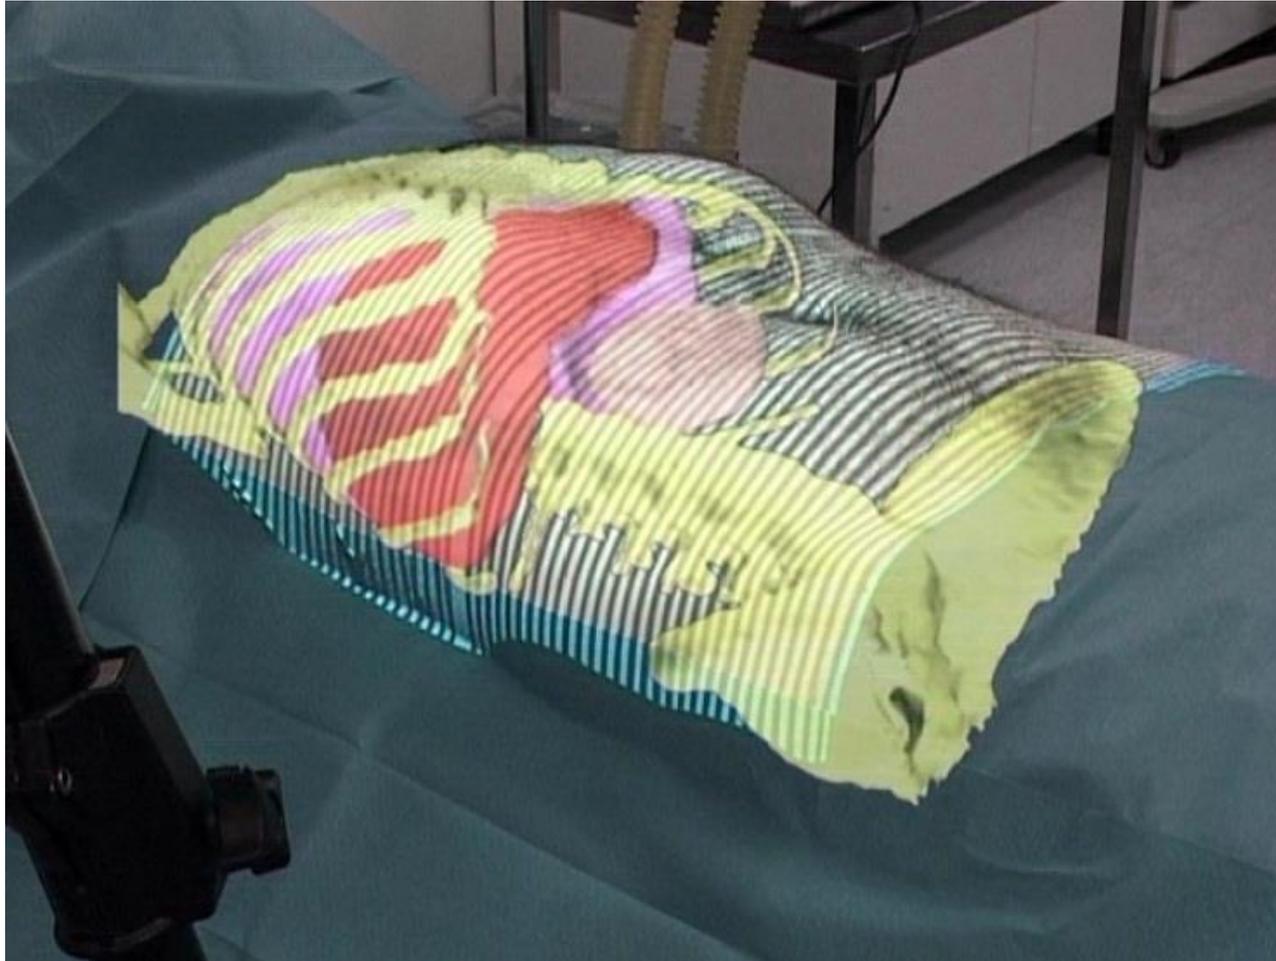

IRCAD's Method

Computation of the cranio-caudal average value

Automatic Registration: non rigid

A real-time predictive simulation of abdominal viscera position during quiet free breathing,

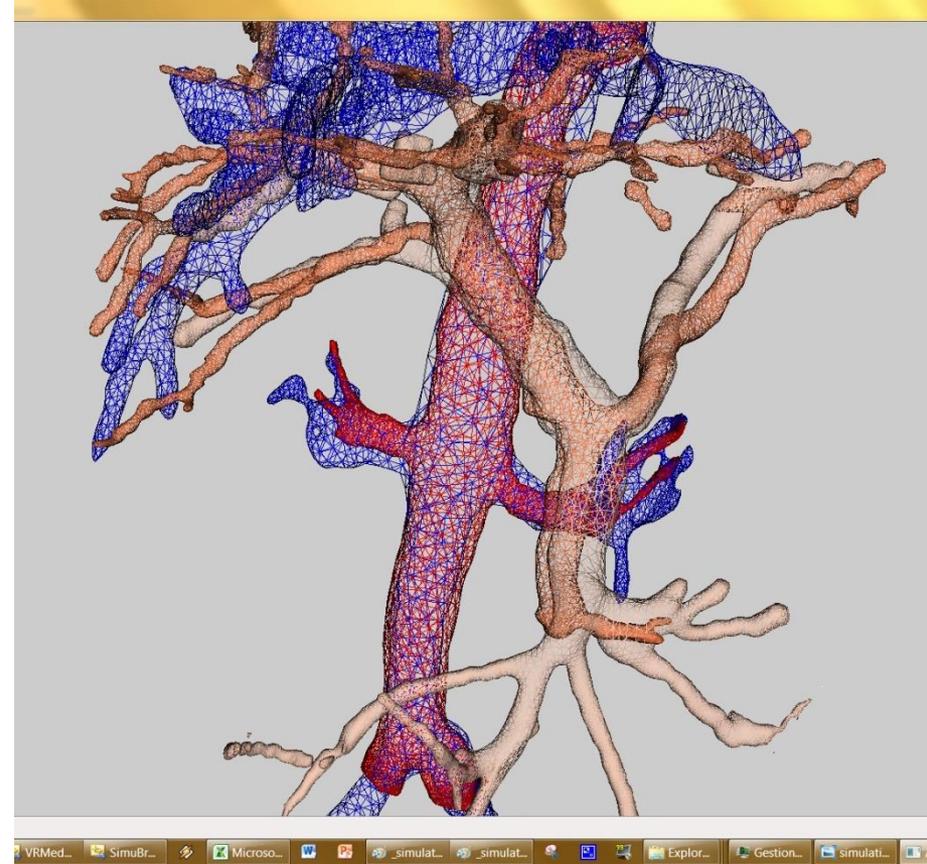

A. Hostettler et al., *Prog Biophys Mol Biol.* 2010 Dec;103(2-3):169-84.

Validation

Comparison between 2 position of breathing segmented CT and simulated position

Organs	Patient I	Patient II
Liver	2.4 mm	2.2 mm
Right Kidney	1.9 mm	1.7 mm
Left Kidney	1.7 mm	1.4 mm
Spleen	2.8 mm	2.3 mm
Pancreas	X	2.5 mm

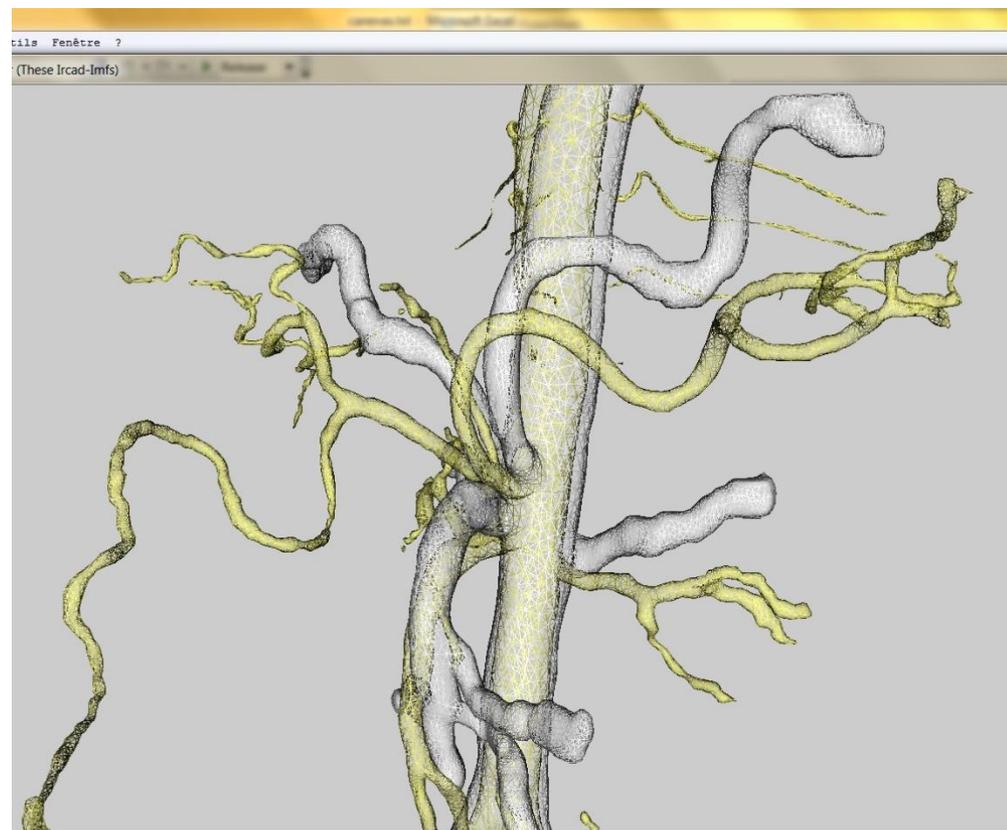

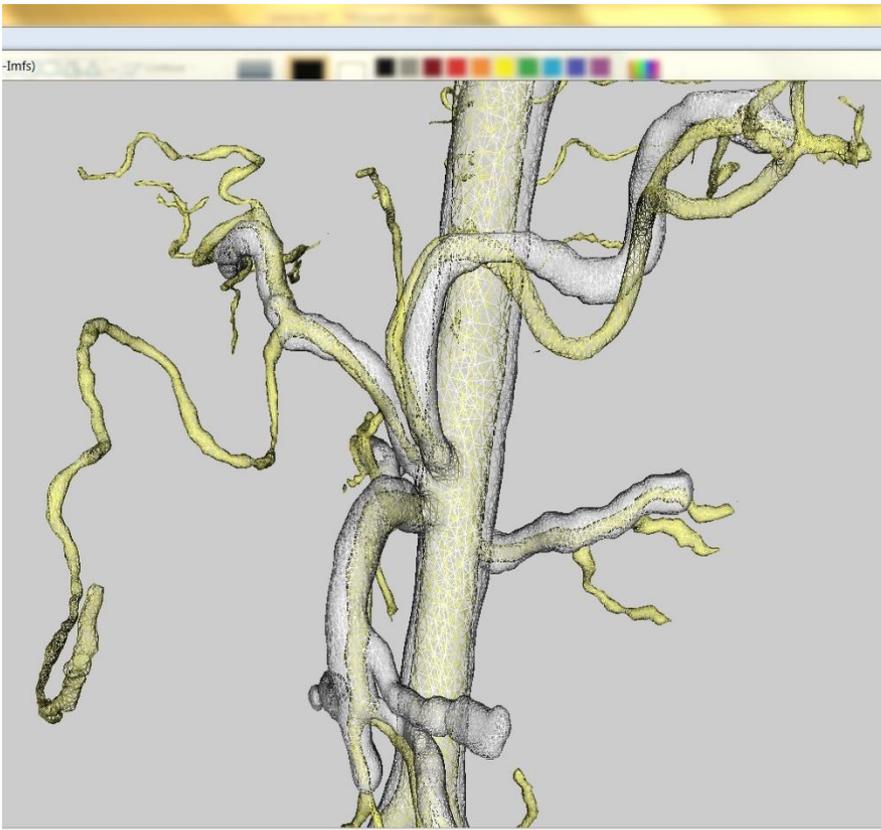

Automatic Registration: non rigid

Before
Error on main veins < 1 mm (real-time)

After

Automatic Registration: non rigid

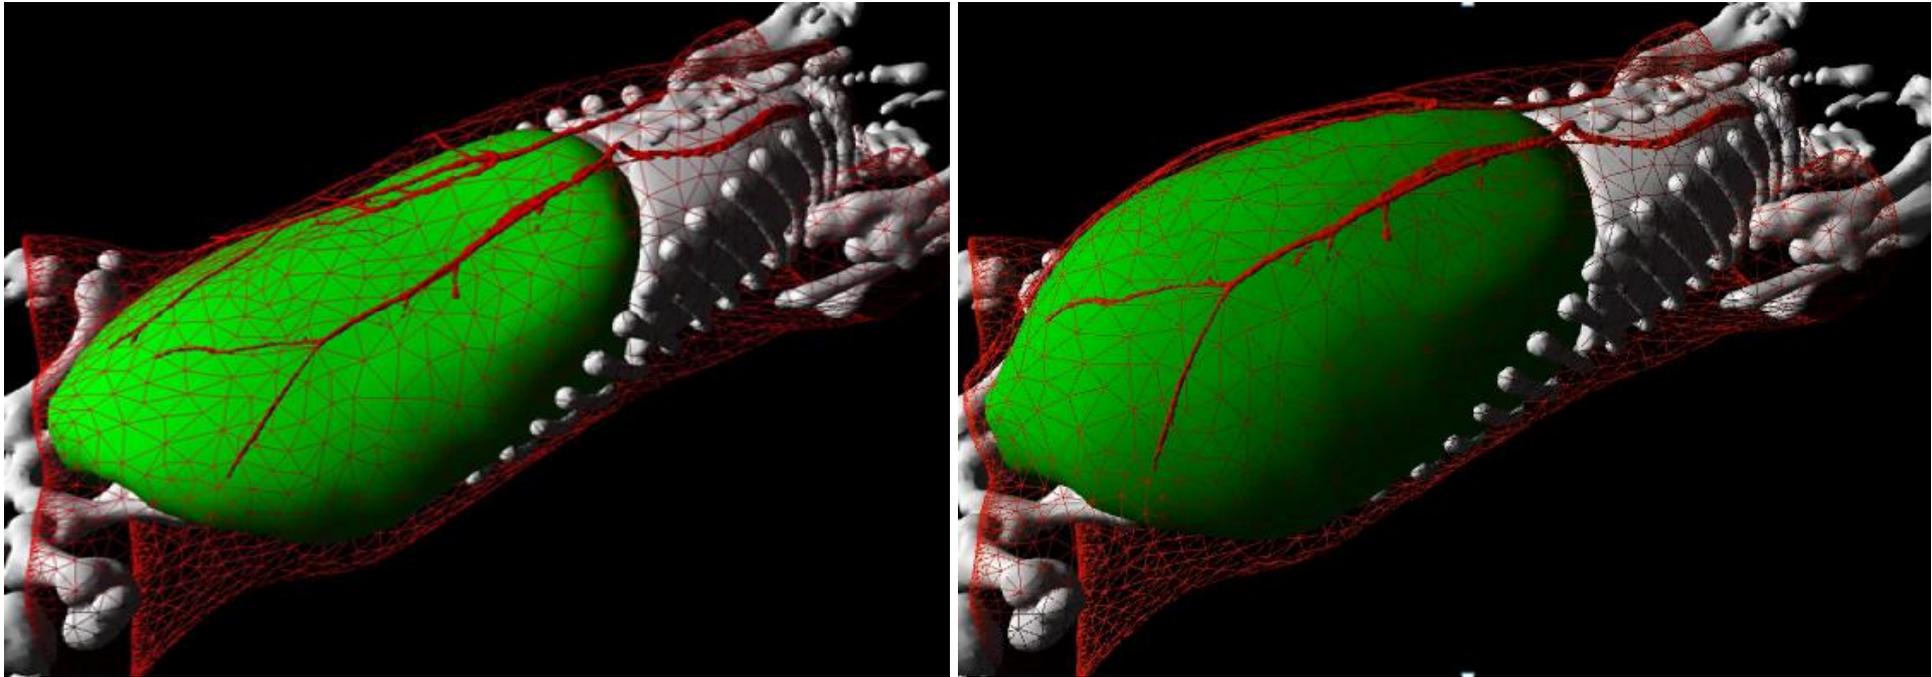

Before

After

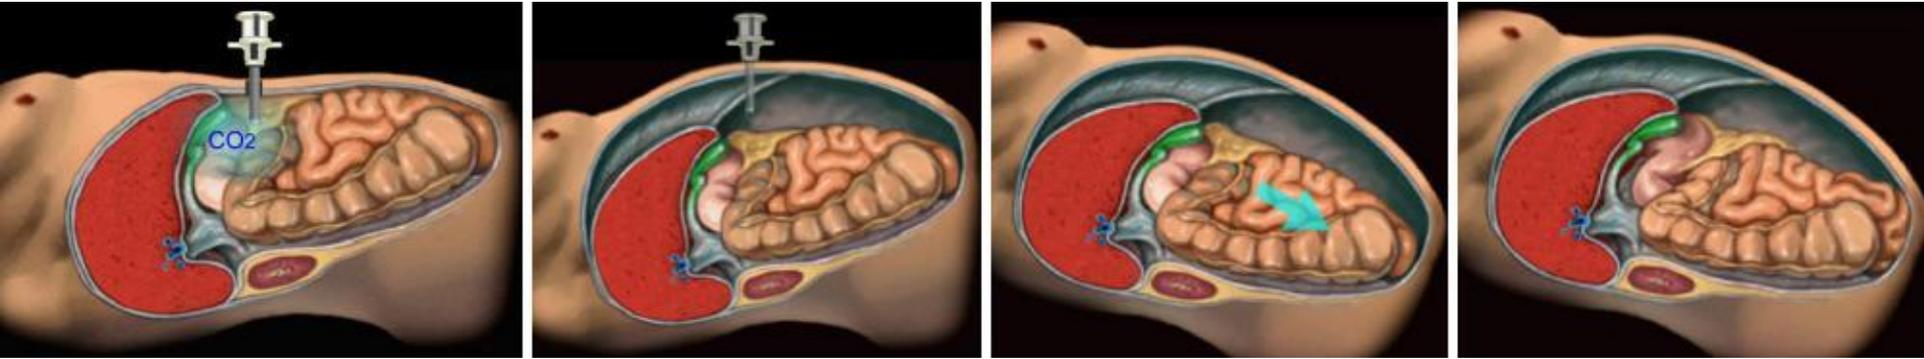

Error on main arteries < 1 mm (real-time)

Step 2 : Pneumo-peritoneum simulation

Simulation of Pneumoperitoneum for Laparoscopic Surgery Planning
Bano et al. , MICCAI 2012

Step 3: Surgical Table displacement

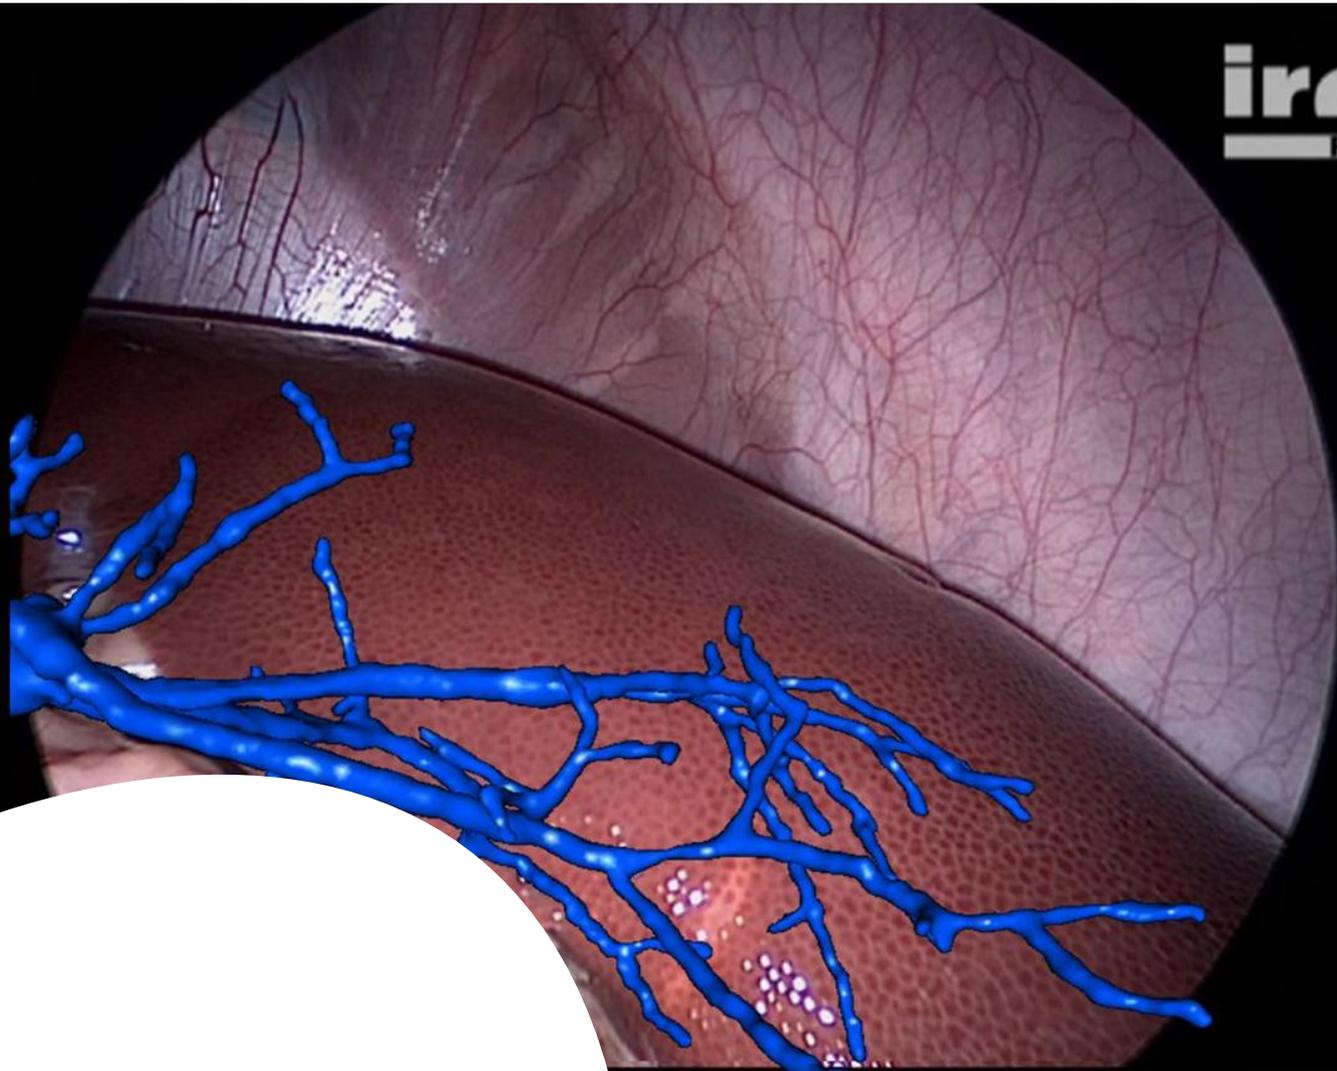

CT or MRI preop position \neq OP-room position

Pneumoperitoneum + Table displacement
changes organ positions

Step 3 : Automatic Registration Zeego

ihu
STRASBOURG

ircad
France

IHU Lasar Project

ihu
STRASBOURG

ircad

Step 4 : Other trocarcard positionning

- Do not modify organs position
- Allows for surgical instruments introduction

Need : Recognition and Tools tracking

Step 4 : Tools Recognition & Tracking

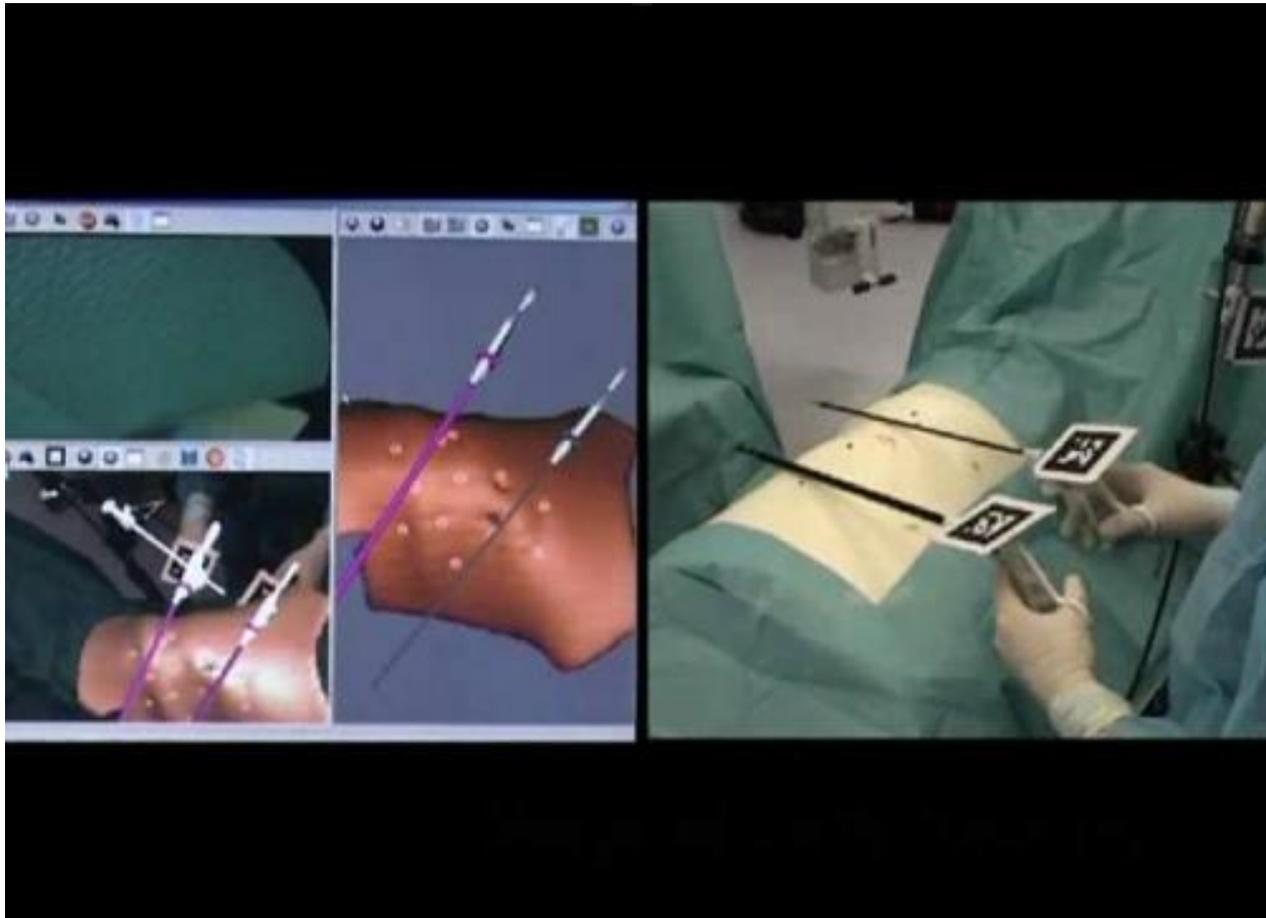

➔ Optical tracking

Most frequent system

Step 4 : Tools Recognition & Tracking

➔ AR-Tag Optical tracking

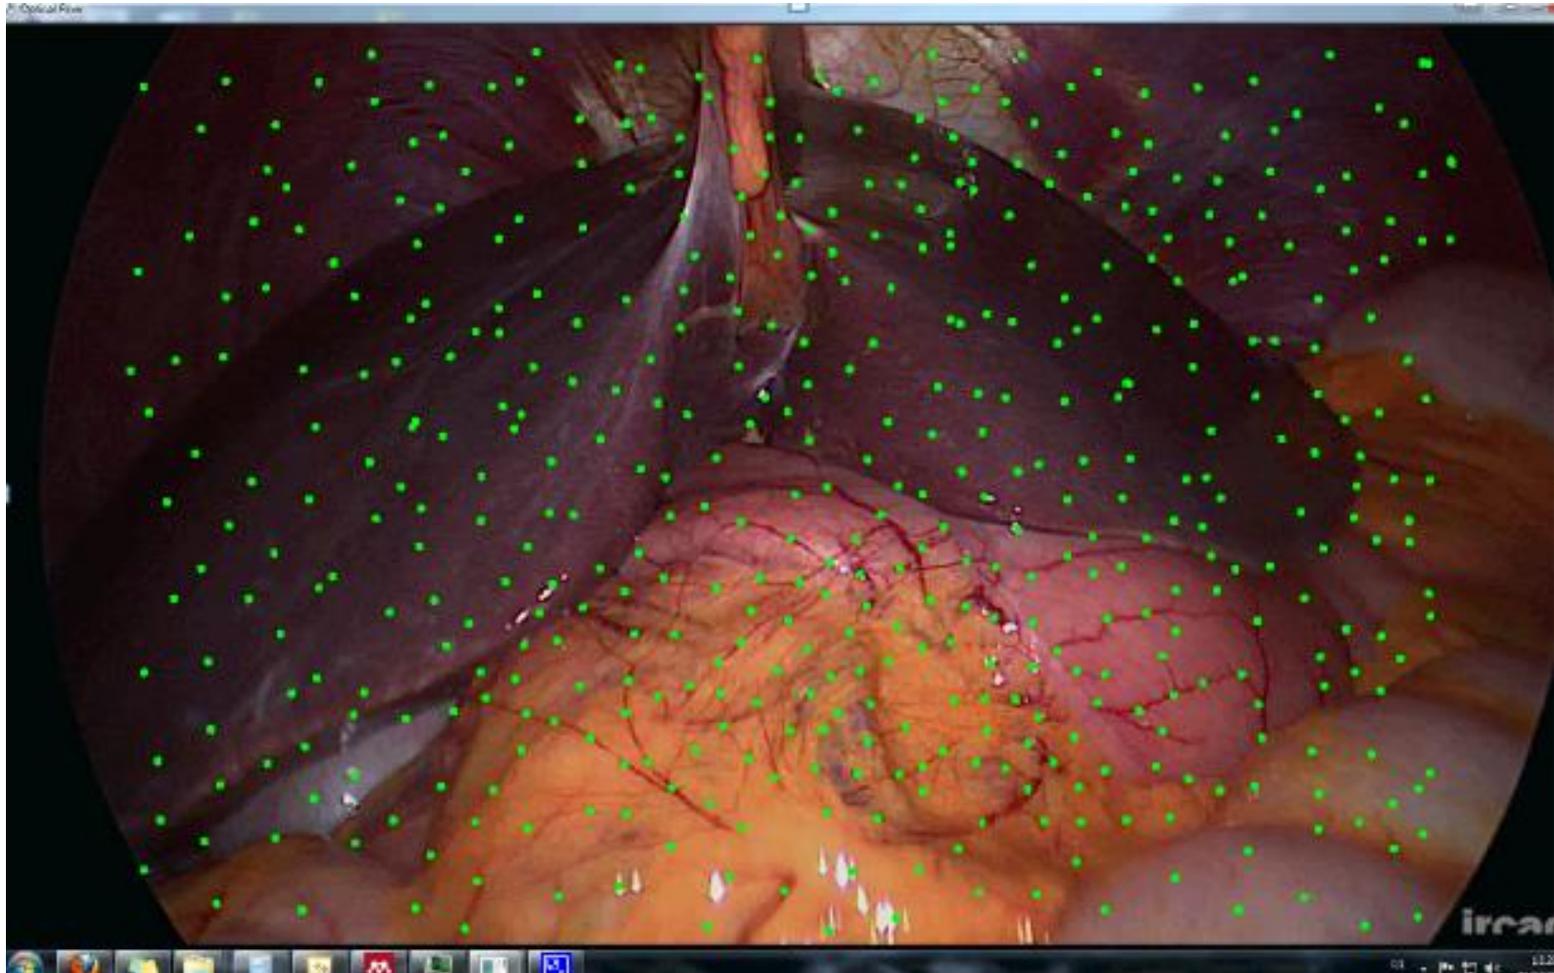

Based on normal camera

Step 5: Laparoscopic exploration

Step 5 : Laparoscopic Exploration

Feature Tracking : no need of optical tracking

Step 5 : Laparoscopic Exploration

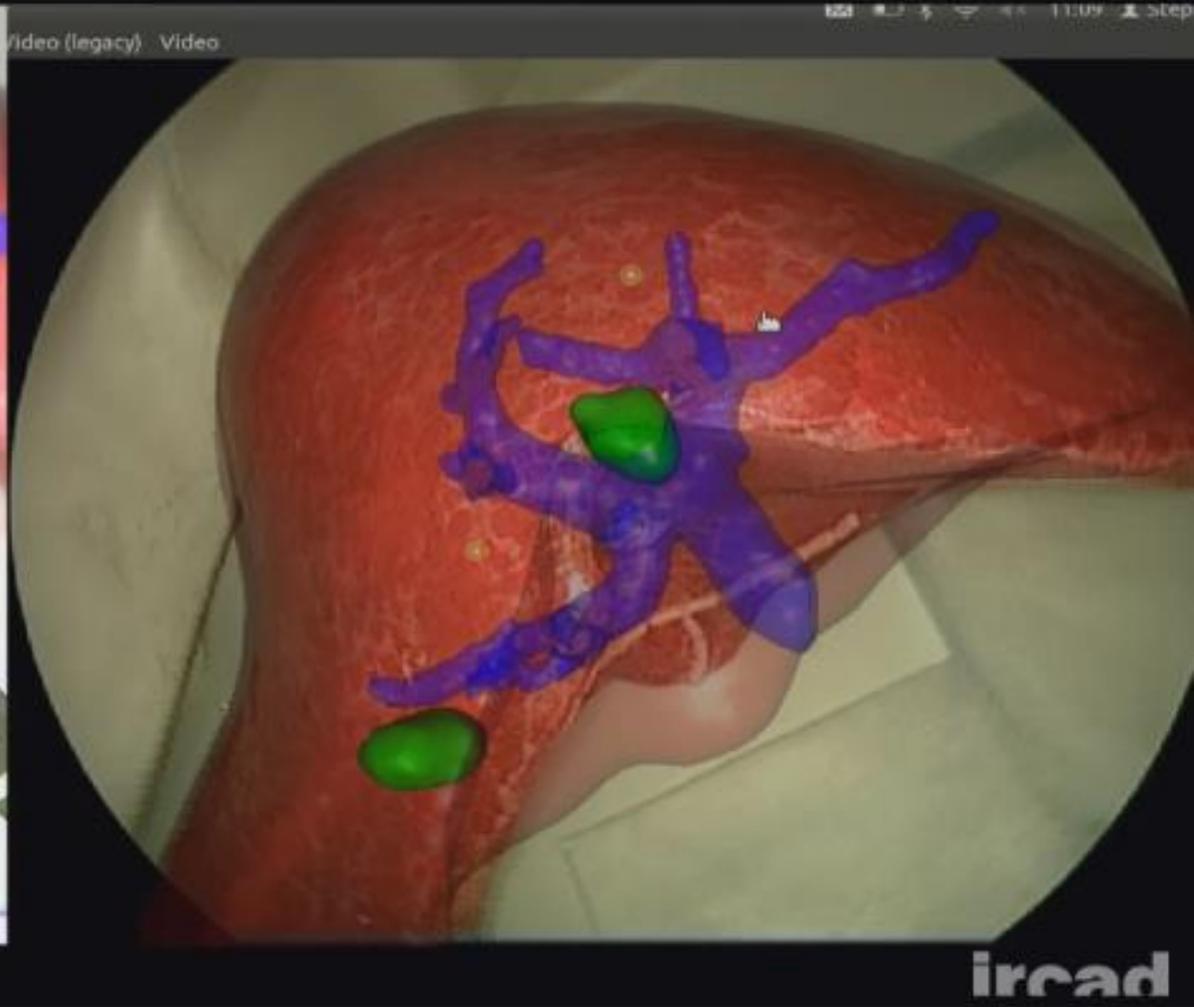

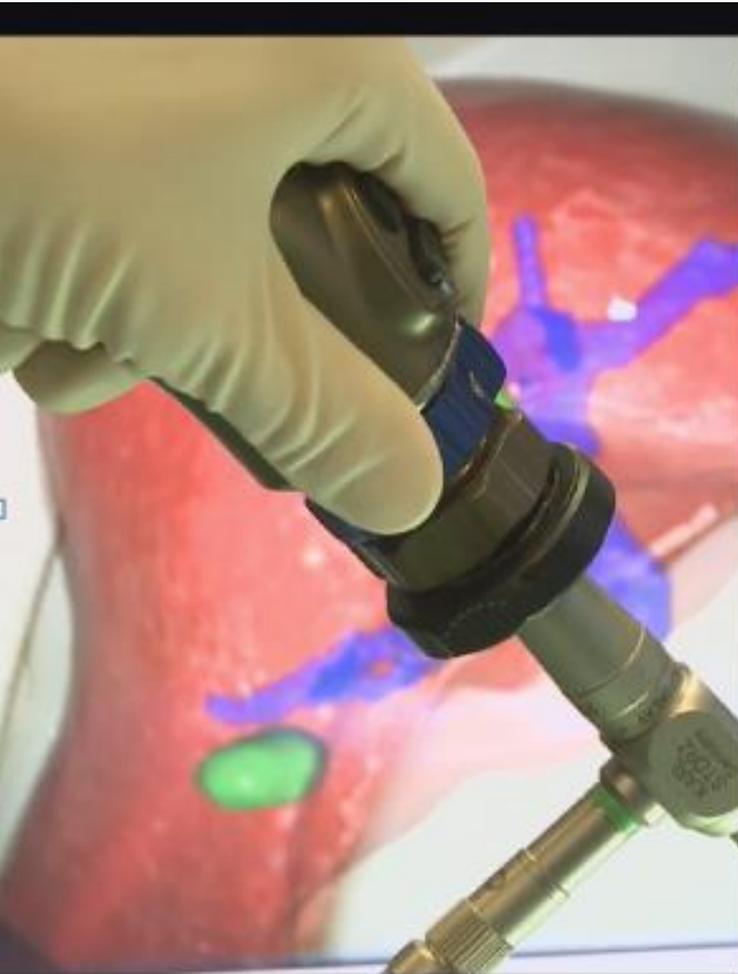

Feature Tracking

Improvement of classical method over 300%

Performance evaluation of simultaneous RGB analysis for feature detection and tracking in endoscopic images
Selka et al., Medical Image Understanding and Analysis 2012

Step 5 : Laparoscopic Exploration

Feature Tracking application to automated AR

Step 5 : Laparoscopic Exploration

Feature Tracking application to automated AR

Step 5 : Laparoscopic Exploration

Feature Tracking + Real-time Registered Simulation

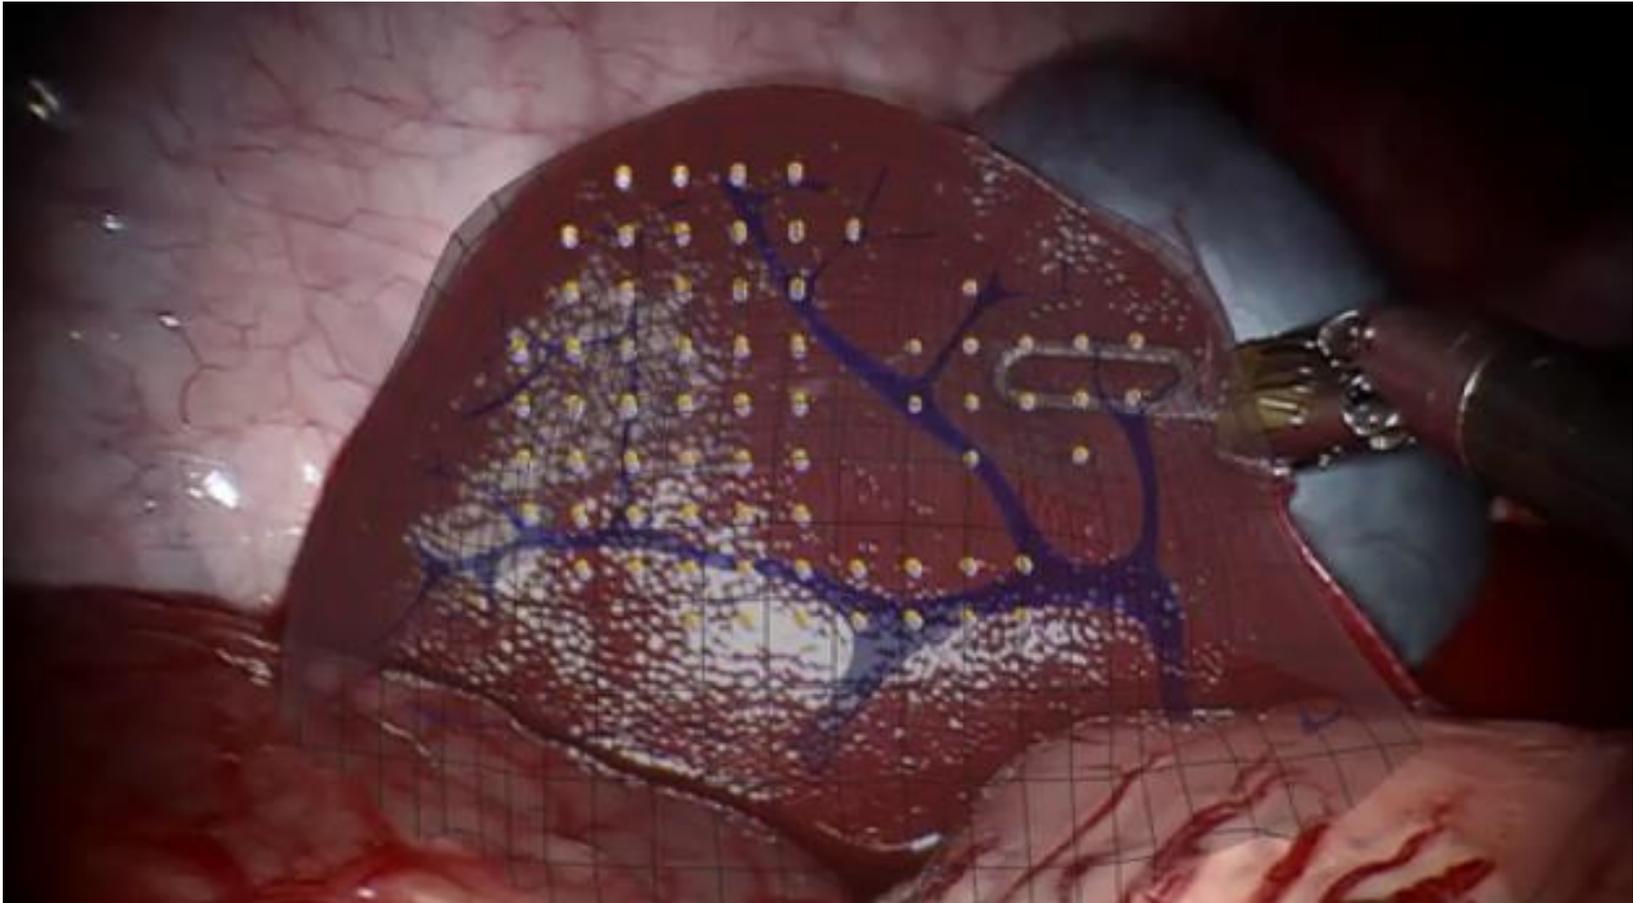

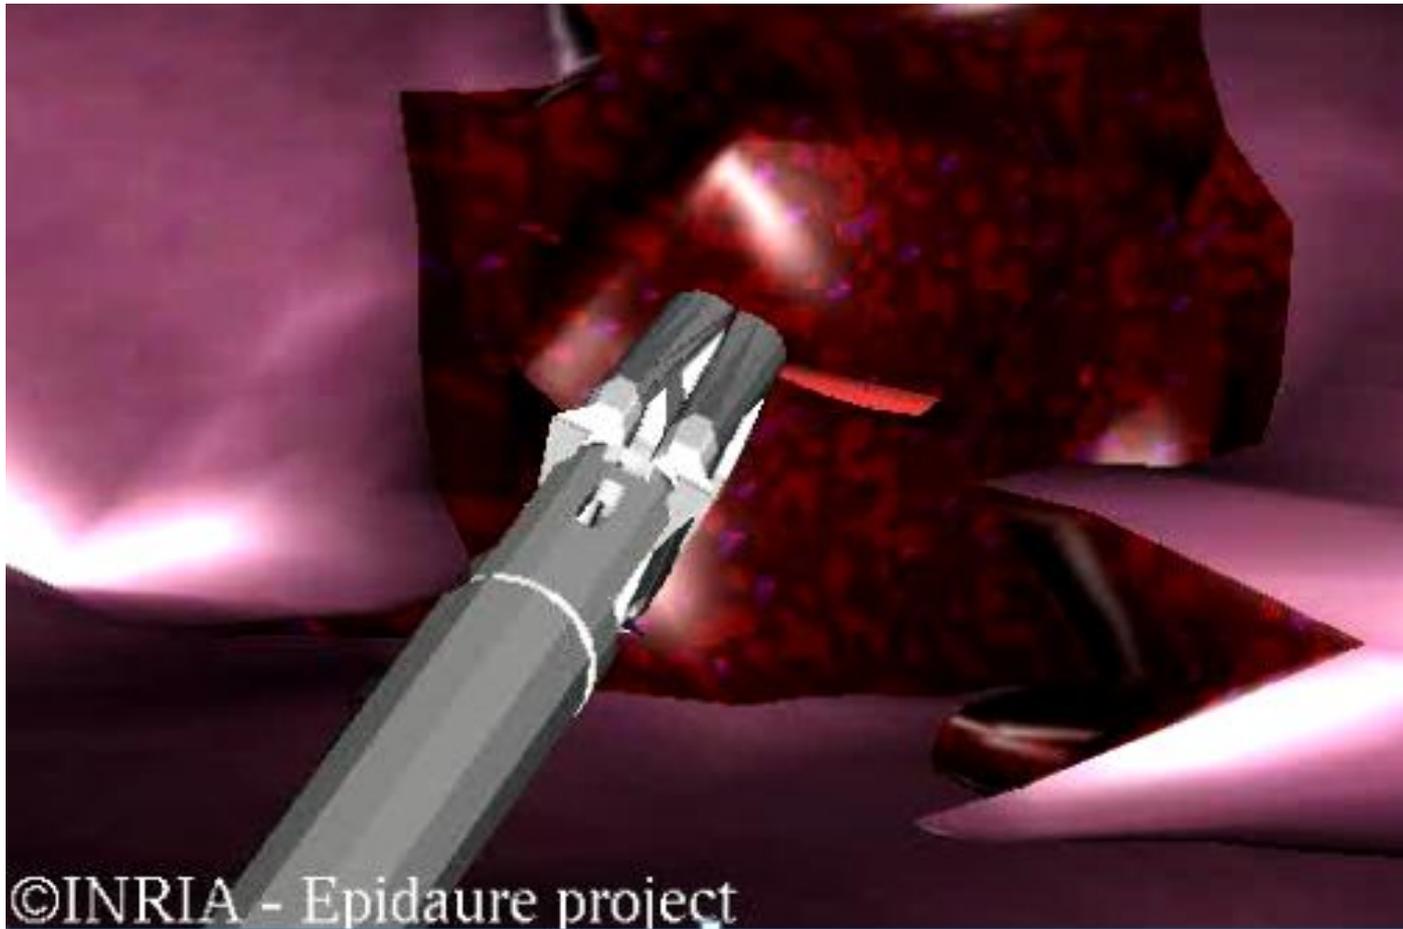

Image-guided Simulation of Heterogeneous Tissue Deformation For Augmented Reality during Hepatic Surgery, Haouchine et al., ISMAR 2013

Step 6 : Removal of liver links
Step 7: And Hile vessels control

Step 8 : Liver Resection

Real-time Registered Simulation

©INRIA - Epidaure project

IHU – IRCAD : R&D Objectives

**Robotics &
Automation**

Develop optimized robots

What is the best solution to clean an house floor ?

Biggest but technological demonstration more sexy

Develop optimized robots

What is the best solution to clean an house floor ?

Biggest but technological demonstration more sexy

Develop optimized robots

The most important is not the size
but the efficiency to reach the objective

Develop optimized robots

What is the best solution for Abdominal Surgery ?

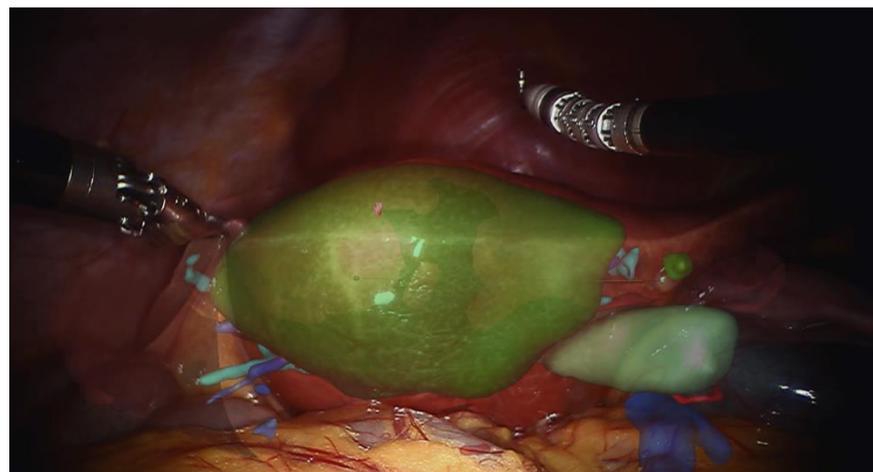

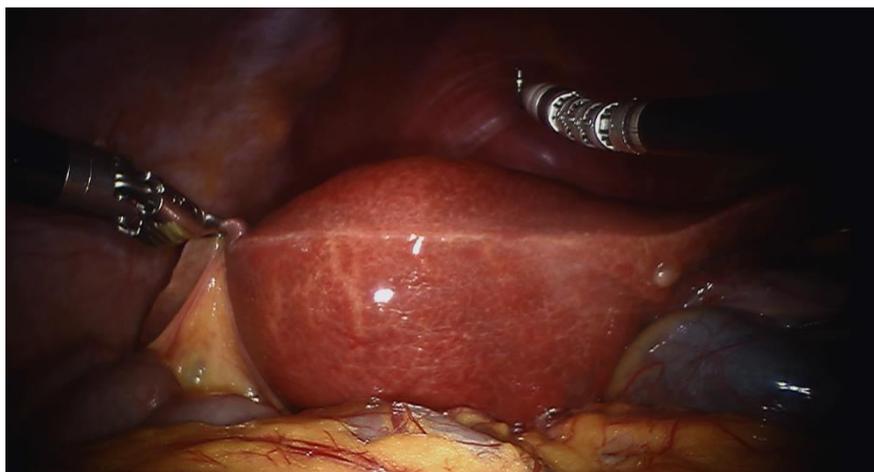

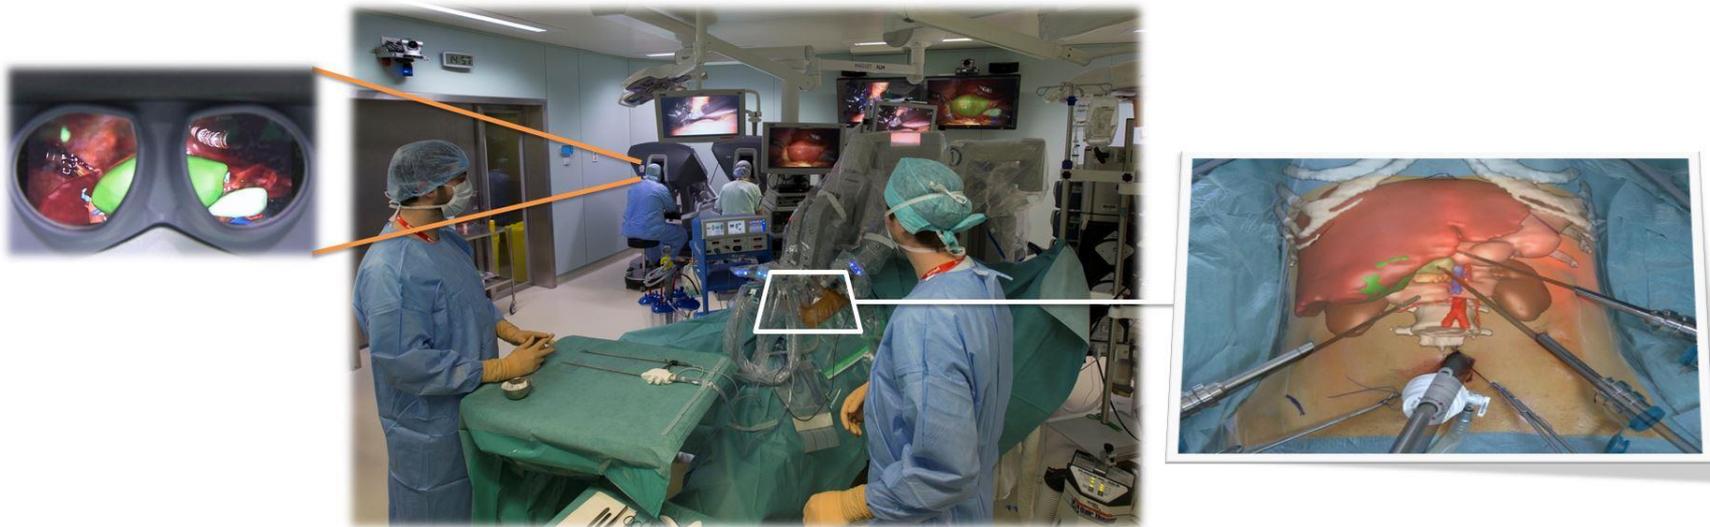

Large Robot, several incision,
Limited Patient access,
But Precise and Robust
Commercial success

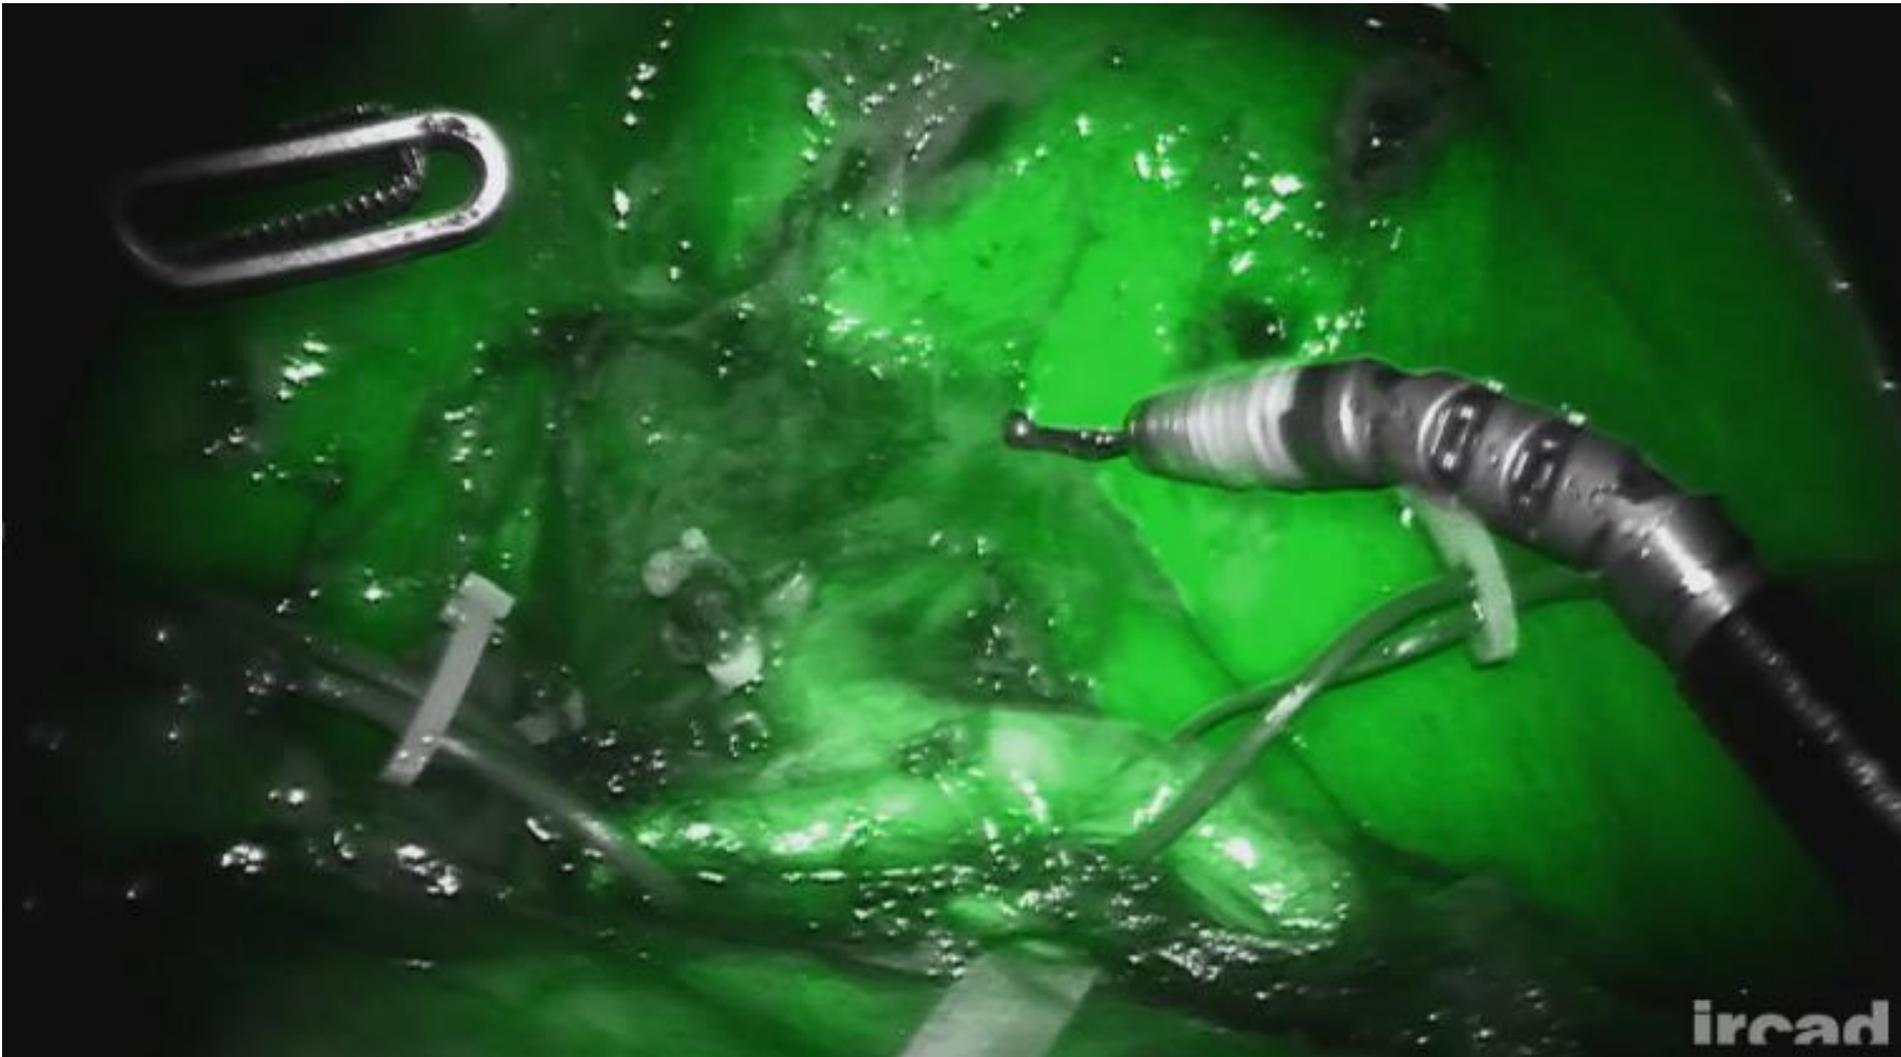

Small Robot, 1 incision,
Large Patient access,
But Less Precise and less Robust
Not Commercialized yet

Interactive Augmented Reality

Robotic Liver Surgery, AR-Surg©IRCAD

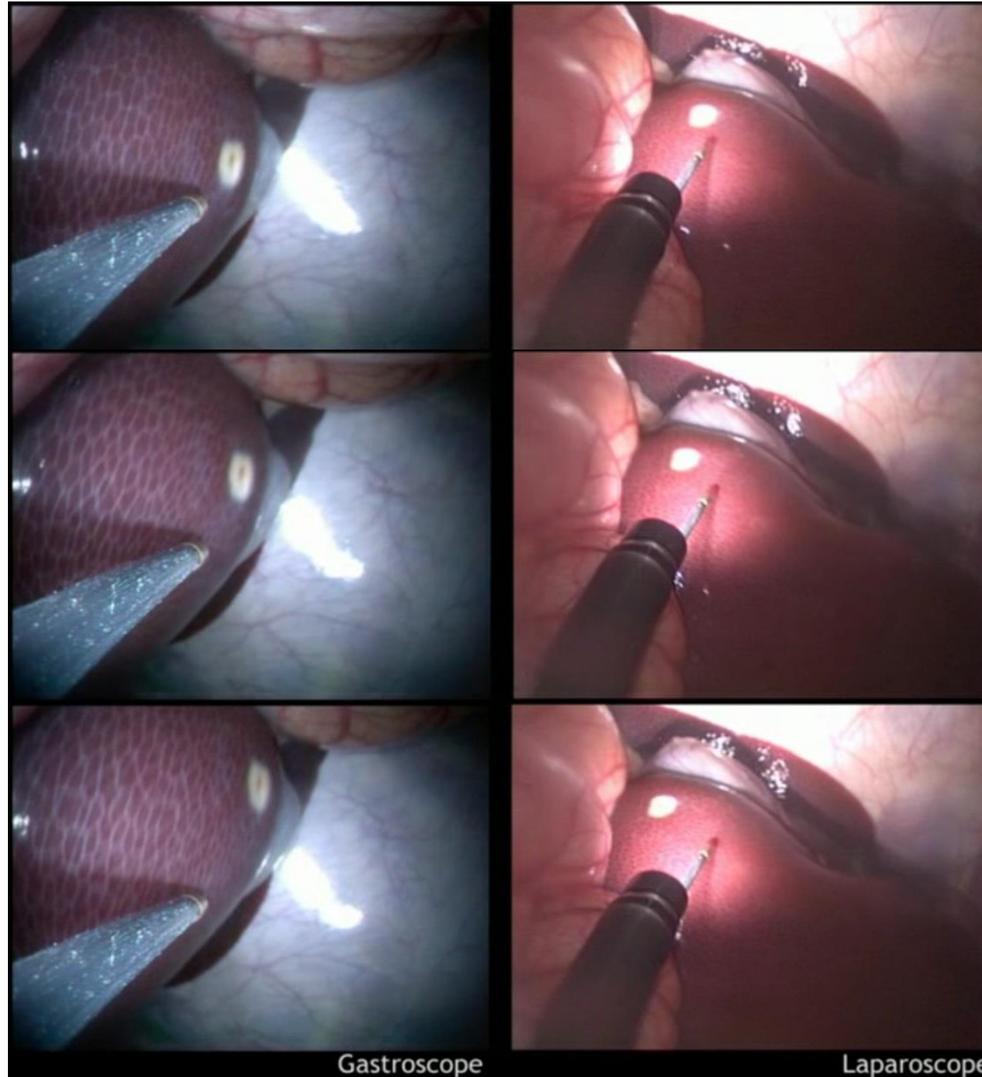

Augmented Reality + Fluorescence

Robotic Liver Surgery, AR-Surg©IRCAD

Next Step: Automatic Movement filter

Operative
vision of the
flexible
endoscope

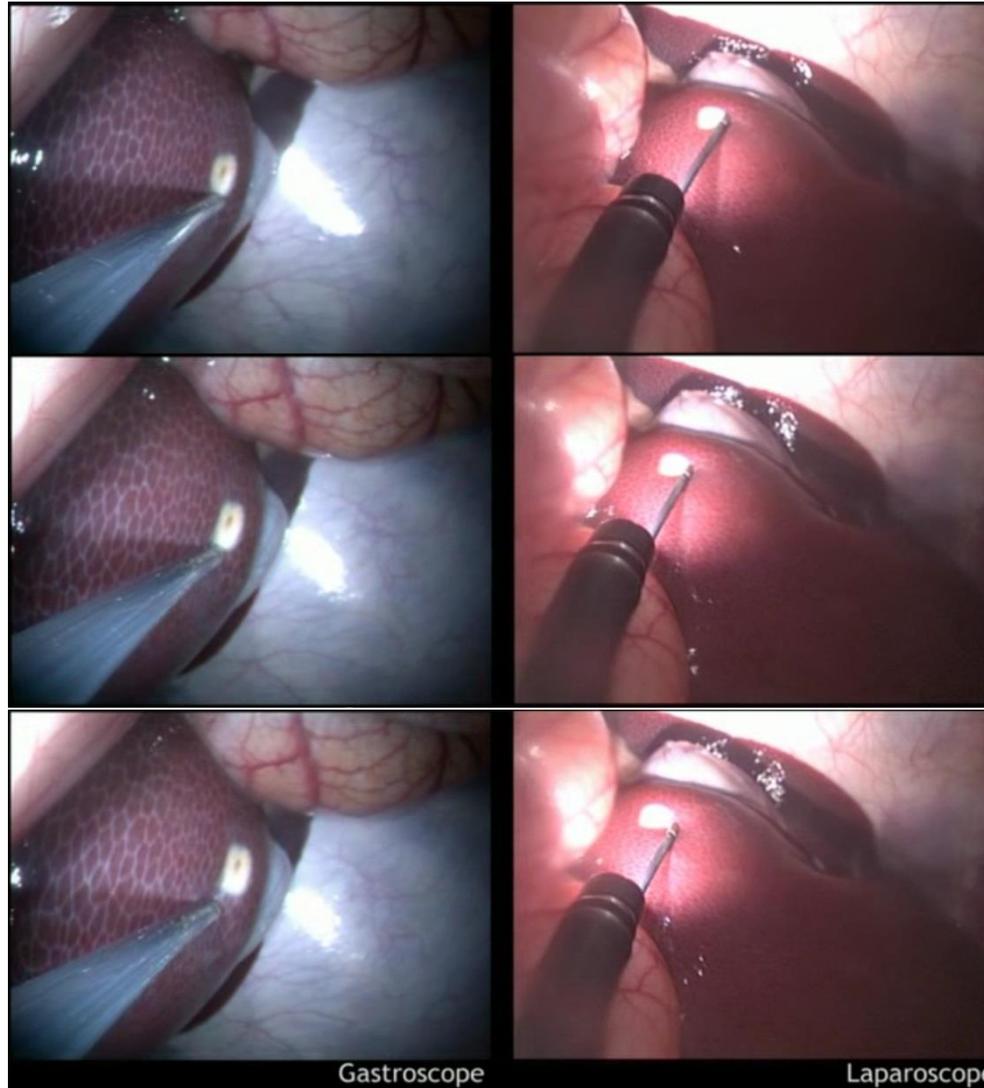

Laparoscopic
view showing
that the
endoscope
do not follow
breathing
movements

Without the robotized system

Next Step: Automatic Movement filter

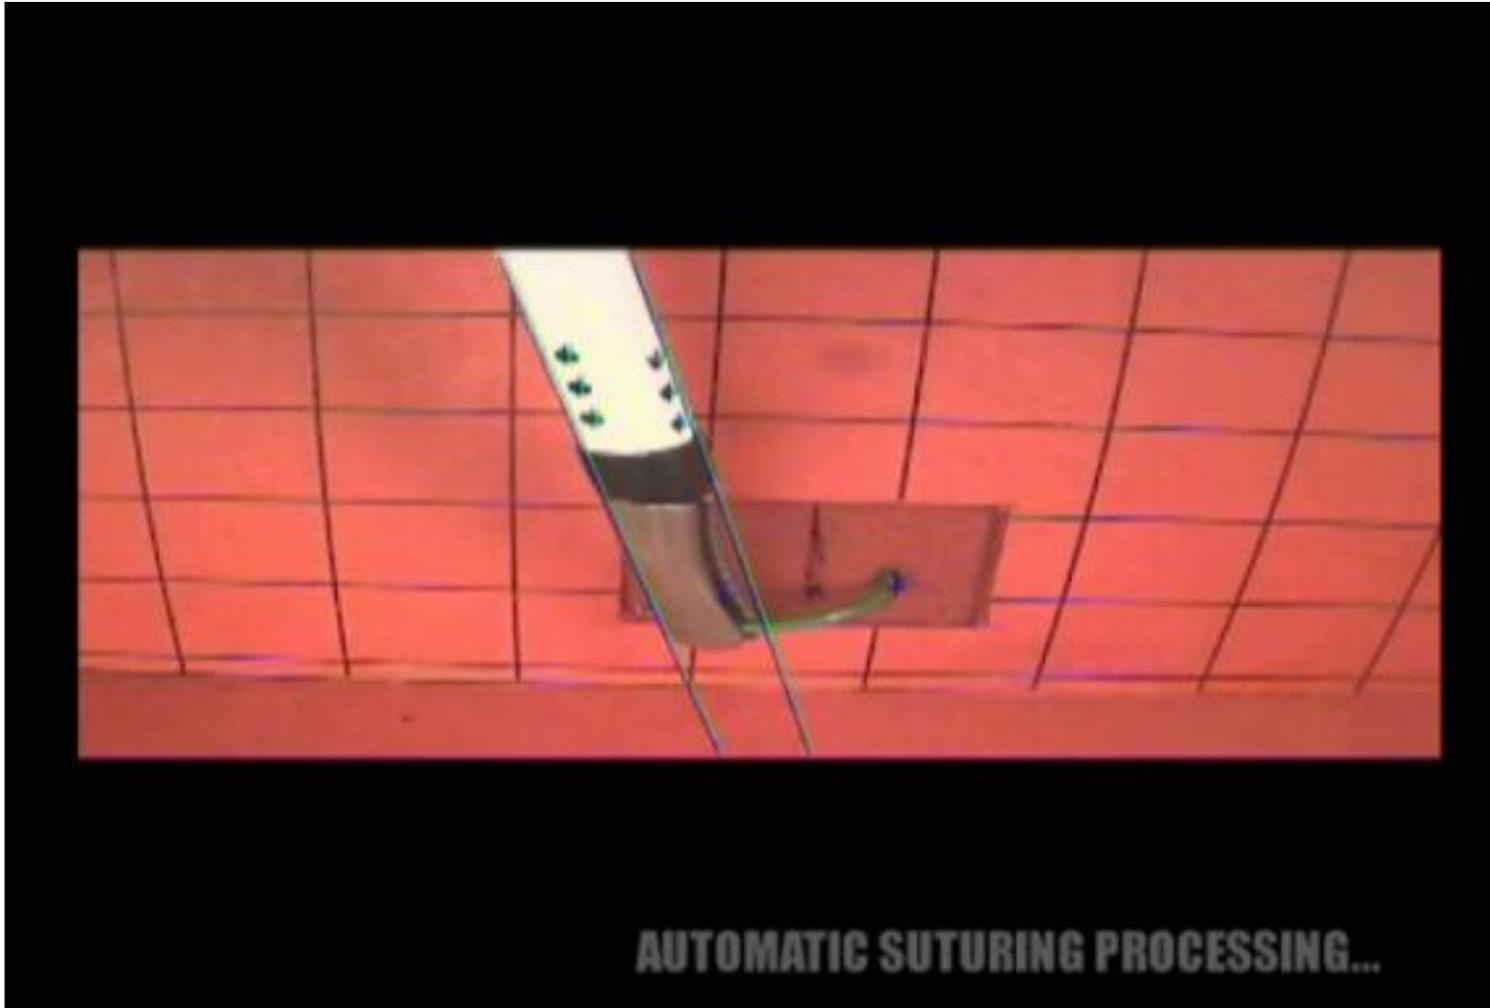

Operative
vision of the
flexible
endoscope:
Target is
always at
the center of
the image.

Laparoscopic
view showing
that the
endoscope
follows
breathing
movements

With the robotized system

Next Step : Automatic Driving

Conclusion

Future of Surgery will be Image Guided

Future Hybride OP-Room

Conclusion

Computer assistance must :

- Improve the usual procedure
- Propose Easy to use solutions
- Follow the Surgical Workflow
- Provide more safety to patient
- Reduce Human error through accurate automation

CONCLUSION

Research & innovation in medicine is for human like the walk for a baby: It's a non reversible need to stand up to be alive, despite the inevitable falls punctuating his quest.

Prof. Luc Soler

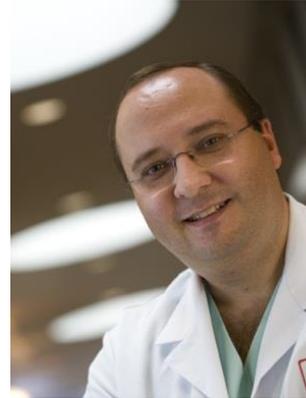

IRCAD-IHU R&D Director

CONCLUSION

**Do not be affraid by
fall, but fear to
never stand up !**

Prof. Luc Soler
IRCAD-IHU R&D Director

Thanks for your attention
