This demo will be organized in three parts:

In the first part, we will show a complete scenario for editing an entry, revising it and integrating it into the database. We will also show the edition of an interlingual link between two entries of two different languages. The show will be completed by the process of adding a new language in Papillon.

The second part will cover in details the technical aspects of the generic and semi-automatic editing tool that is used on Papillon server. The tool generates an interface from the XML schema of a dictionary entry.

The third part will be devoted to feedback from the potential contributors. What can be improved in their point of view, what should be the following improvements.
