Out-line

- I – Introduction
 - Ontologies, lexicon: some definitions
 - 3 perspectives on the relation between ontology and language
- II – Knowledge representation issues
- III – Text as knowledge source

I – Introduction: ontology

- **Ontology** – a philosophical perspective
 - *discipline* concerned with the study of existence and the formal description of the structure of reality
- **Formal ontology** – logical perspective
 - *logical theories* describing some aspect of reality, that is of relevance to a set of applications
 - a *logical theory* accounting for the intended meaning of a formal *vocabulary* i.e., its ontological commitment to a particular conceptualization of the world (Guarino 1998), by referring to the nature and structure of the entities.
- **ontologies** – knowledge engineering perspective
 - a *formal explicit description* of concepts *in a domain of discourse* (Noy and McGuinness, 2000)

I – Introduction: structure of an ontology

- **Classes** (concepts) and their **members** (instances) : *university*, *Toulouse Capitole*
- **subclass axioms**: e.g., Science university is_subclass_of University
- **non-taxonomic relations**: e.g., University hasDean Person
- **domain and range restrictions** (on relation): restrict which kind of entities can stand at the domain and range positions, respectively
- **cardinality constraints**: University has (at least) one student
- **Part-of relations**
- **Disjointness**: disjoint classes have no common member

I – Introduction: lexicon

■ Definition

- ❑ Lexicon / Thesaurus / Lexical Data-base
 - ❑ List of words with definitions / and lexical relations / paper or stored in a DB
 - ❑ Linguistic grounding: the use of words in language determines their definitions
- *The main difference between an ontology and a lexicon, lexical database or thesaurus is that all of the latter are linguistic objects while ontologies are not (they are logical theories). (Ciminao, Volker, Buitelaar, 2010)*

I – Introduction: ontologies vs lexicons

ontology

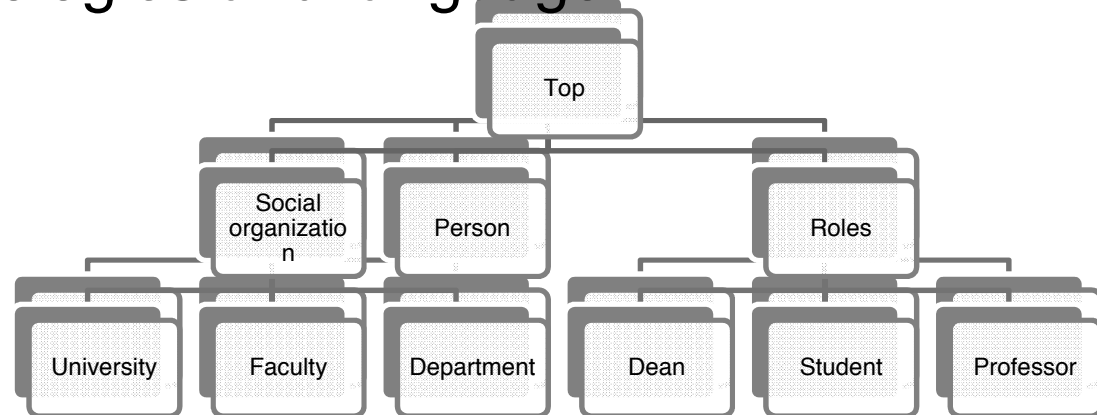

- Concepts, logical primitives
- SubclassOf hierarchy
- Semantic relations (partOf, ingredientOf, causes, hasDean, ...)
- Formal definition
- To be created/ modified/ used by a program

lexicon

- Words or terms or entries
- Broader/narrower relations (hypernymy)
- Few lexical relations (seeAlso, meronymy, antinomy, ...)
- Linguistic definition
- To be read, used by a human or a program

I - Ontologies versus lexicons

- Ontologies can be used
 - In man-system interaction system
 - For semantic annotation of documents
- Ontologies may be defined from the linguistic expression of knowledge
- Concepts and linguistic expressions are connected
- How to connect ontologies and language?

I- Ontologies, lexicon and text: 3 perspectives on this relation

- Design paradigm for ontologies
 - What theory/domain do we refer to give a meaning to the ontology concepts ?
 - Language can be the reference
- Knowledge representation
 - How to store the lexicon required to make formal concepts understandable by a human?
- Knowledge « acquisition »
 - Building Ontologies from text
 - How can linguistic phrases and text be used as knowledge sources ?

I – Ontologies, Lexicon and text: Design paradigms for ontologies

- Issue: which evidences for concept definitions? Which means to access to the “right” concepts to be set in an ontology?
- Ex of paradigms
 - **Philosophical**: Ontology or Formal Ontology, distinction between predicates are based on properties that we are able to perceive or identify in word entities (Husserl)
 - **Linguistic**: language in use, lexical distinctions -> conceptual distinctions
 - **Pragmatic**: only those concepts relevant for the application will be defined
 - **Cognitive**: what is intuitively perceived as different leads to different classes (no need for an explicit and formal specification of differences).

I - Ontologies, text and lexicon: linguistic paradigms

■ Possible assumptions

- Linguistics, terminological distinctions justify conceptual distinctions
- (or) classes exist independantly of their lexicalization
- (or) classes are defined in the ontology if required by the application, and are then connected to their lexicalization

Out-line

- I – Introduction
 - Ontologies, lexicon: some definitions
 - 3 perspectives on the relation between ontology and language
- II – Knowledge representation issues
- III – Text as knowledge source

II – Knowledge representation

How to add some linguistic, terminological information to an ontology?

- Standard solution
- Early works
- Sophisticated (meta-)models of lexical ontologies
- Recent (meta-)models

II – Standard solution

- in OWL language: “Label” annotation
Rdf:label “université des sciences”@fr
Rdf:label “science university”@en
<rdfs:label xml:lang=« fr »>université des sciences
</rdfs:label>
- Annotation
 - All the labels of one concept and in the same language are synonyms
 - Comment, unstructured data
 - No grammatical information (is it a lemma? An exact form? ...)
- Need for a more complex and richer representation

Early works: lexical Ontologies (Maedche and Staab, 2000)

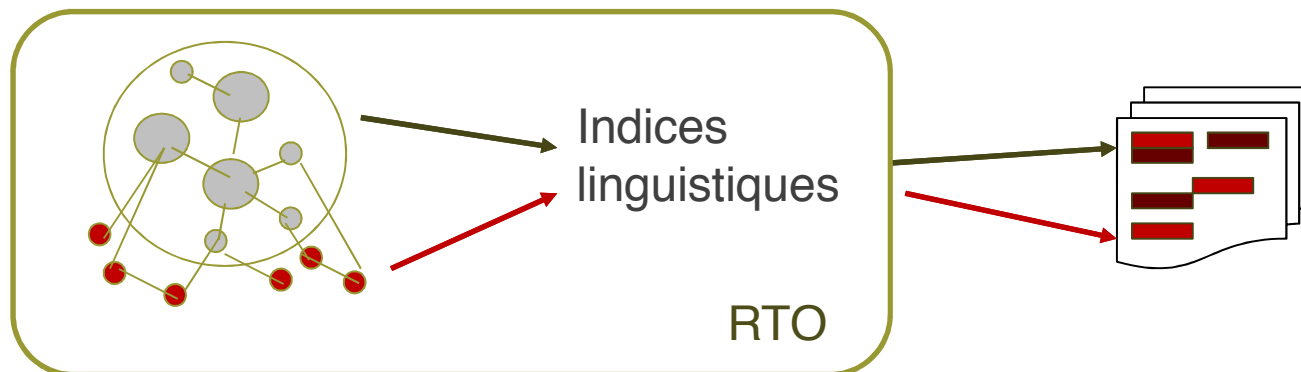

- **Ontology:**
 - Vocabulary : **predicates** for *categories* (C , *unaires*), *properties* (\mathcal{P} , *unaires*) and *relations* (\mathcal{R} , *n-aires*)
 - \mathcal{A} : ensemble **d'axiomes**, formules logiques
- **Lexical component of an ontology**
 - **Lexical Entry:** Formes linguistiques exprimant les prédicats de l'ontologie : ens. \mathcal{L}^C , $\mathcal{L}^{\mathcal{P}}$, $\mathcal{L}^{\mathcal{R}}$ pour les catégories, propriétés et relations
 - **Reference relations** between lexical entries and predicates
- **Termino-ontological resource**

Lexical component of an ontology : example

- concepts atomiques :
 - Personne, Masculin, Féminine, Mère, Enfant
- rôles atomiques :
 - parentDe, mèreDe, pèreDe
- concepts complexes :
 - $\text{Personne} \sqcap \text{Féminine}$
 - $\text{Personne} \sqcap \neg \text{Féminine}$
 - $\text{Personne} \sqcap \exists \text{parentDe}.\top$
 - $\text{Personne} \sqcap \forall \text{parentDe}.\perp$
 - $\text{Personne} \sqcap \exists \text{parentDe}.\top \sqcap \forall \text{parentDe}.\text{Féminine}$
 - $\text{Personne} \sqcap (\text{Riche} \sqcup \exists \text{parentDe}.\text{Riche})$
 - $\text{Personne} \sqcap \exists \text{parentDe}.\exists \text{parentDe}.\top$
- Lexique des catégories
 - Personne, **individu**
 - Masculin
 - Féminin
 - mère, **maman**
 - Enfant
 - riche
- Lexique des relations
 - Parent de, mère de, père de
- Catégories complexes définies par des axiomes
 - Femme, homme
 - Parent
 - Enfant
 - Petit-enfant

Early works: Termino-ontological resources

- 2 meanings in the state of the art
 - Ontologie built from linguistic resources (text)
 - **Enriched ontology with linguistic information**

II – Early works

- Terminae (Biébow, Szulman, Aussenac-Gilles, 2005)
 - Distinction between terms and concepts
 - Concepts are associated terminological forms with rich information about the terms, its interpretations in various contexts.
 - Ex of data in a terminological form: POS, acronyms, various meanings, examples of use, standards and recommendations, ...

Early works: a TOR meta-model

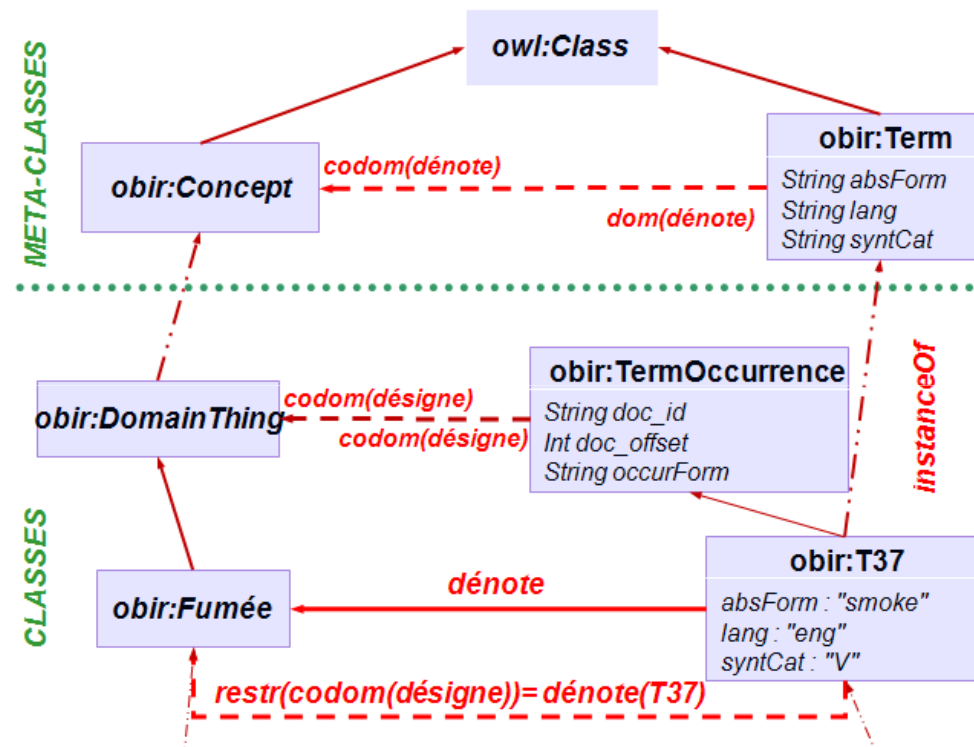

- Why defining terms as classes?

- Associer des informations (POS, langue, ..)

- How?

Define a meta-model

- OBIR (Reymonet et al., 2007) (Reymonet, 2009)
- LingInfo (Buitelaar et al. 2006)

LingInfo meta-model (Buitelaar et al. 2006)

- Linguistic features added to meta-classes
- Goal= manage multilinguisme

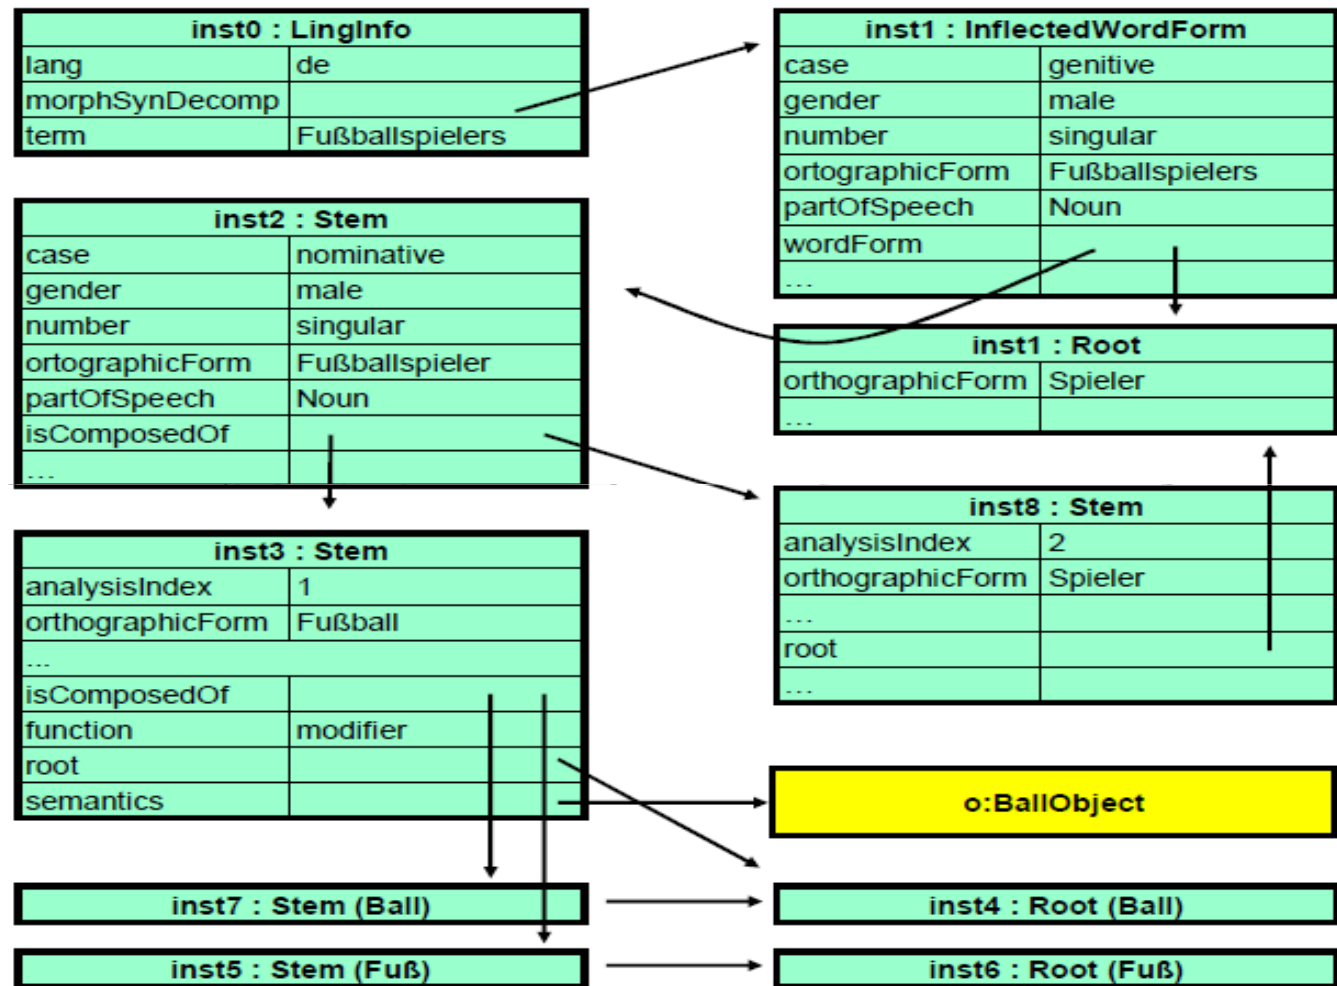

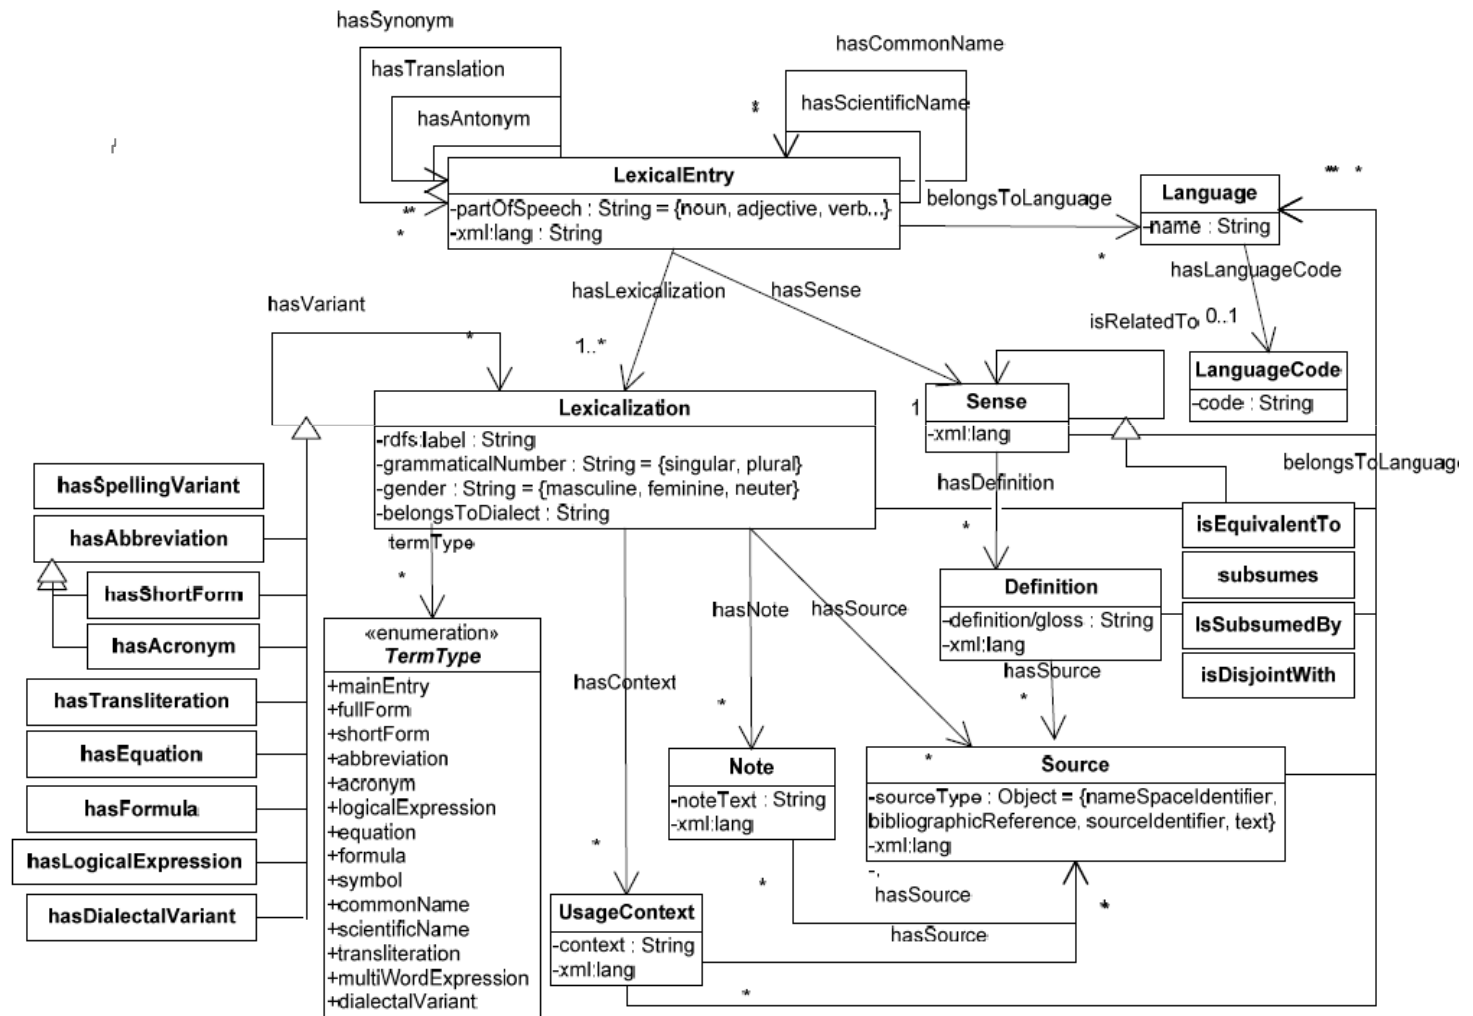

Figure 5: Morphosyntactic Decomposition of "Fußballspielers"

Sophisticated meta-models for lexical ontologies

- Define a linguistic model beside the ontology
 - Dedicated to NLP analyses
 - Makes it possible to manage word derivations, word agglutination, word combination and **Multilinguism**
 - Be more efficient when associating text and concepts
- examples
 - *LexOnto [Cimiano et al. 2007]*
 - *LexInfo [Buitelaar et al. 2009]*
 - *LIR in NEON (Monteil Ponsoda et al., 2008, 2011)*

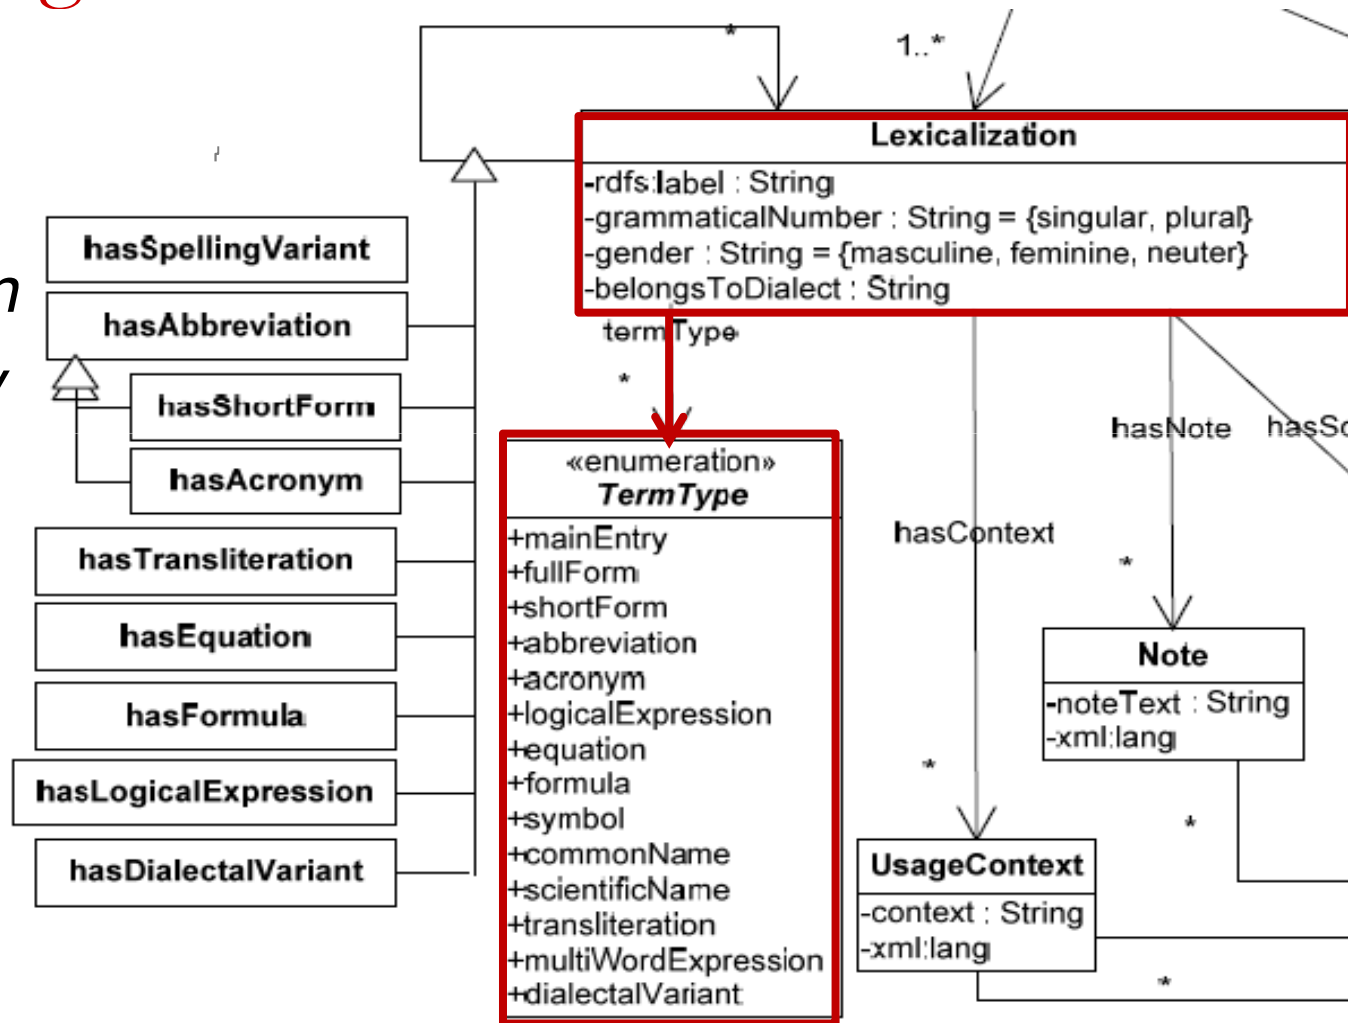

Sophisticated meta-models for lexical ontologies: the NEON model

■ LIR :
Linguistic Information Repository

Sophisticated meta-models for lexical ontologies: the NEON model

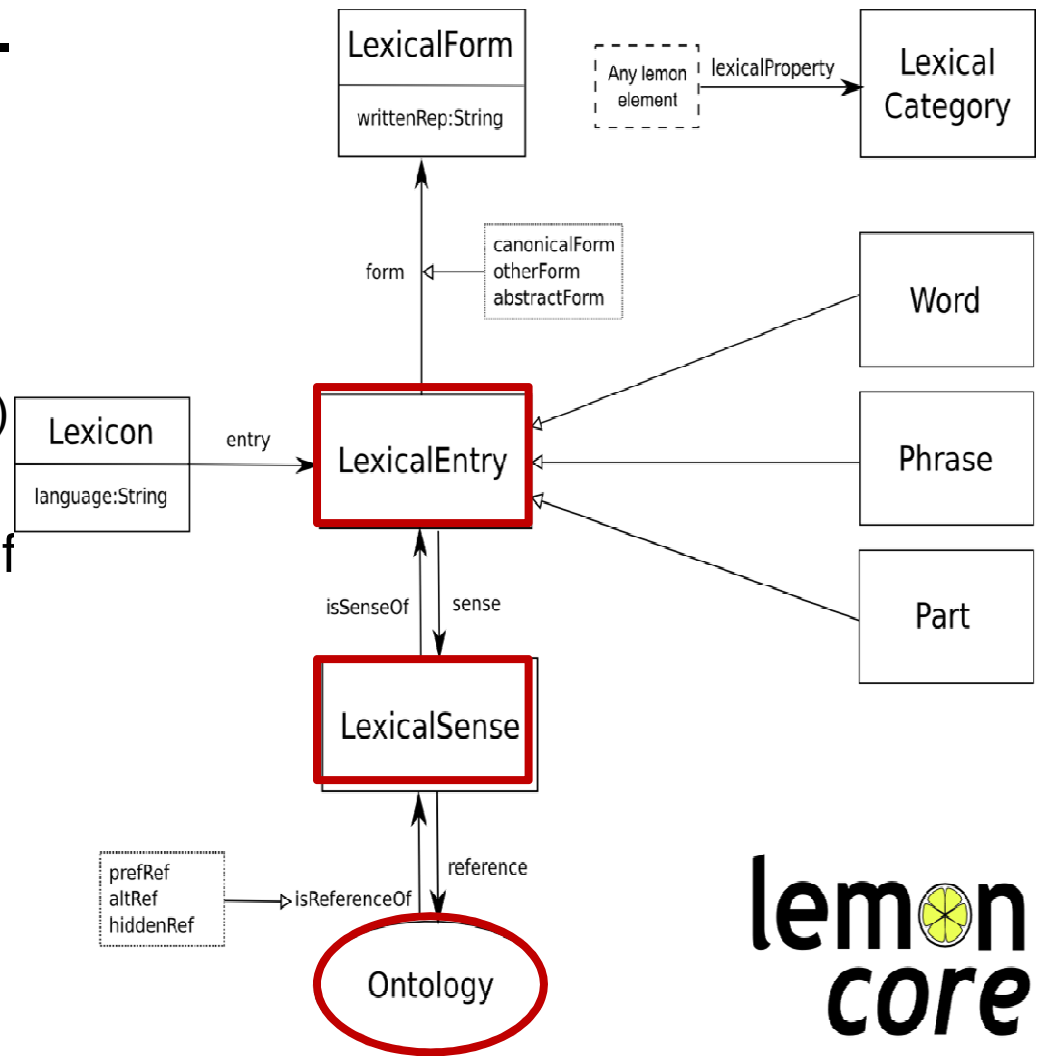

■ LIR :
Linguistic Information Repository

Stabilization : the LEMON meta-model

□ Main Classes of the meta-model:

- **Lexical Entry**
- **Form:** inflectional variant
 - **Representation:** written versions) of the entry
- **Sense** (one of the meanings of the lexical Entry)
- **Reference:** actual meaning in the ontology

III – Texts as knowledge sources

- What are the issues ?
- A layered approach
- Some tools

Quels sont les problèmes ?

- Given a linguistic formulation, how can I represent it?
- How can I identify all the required concepts and their linguistic formulations?
- Building ontologies versus populating ontologies with instances

How to represent a linguistic phrase

→ *hémopéritoine* : « épanchement hématique localisé au niveau du péritoine »

Hiérarchie de concepts

ETAT_PATHOLOGIQUE

Ontology learning vs ontology population

Ontology Learning

Ontology Creation & Development

Building ontologies

From linguistic clues to concepts, relations and properties

Ontology population

Instance extraction and semantic annotation

Layers of linguistic analyses (Buitelaar, EACL 2006)

Each person has one natural mother

Disjoint(person, city)

HasParent(Person, person) ; LivesIn(person, city)

AdoptiveFather is-a Father ; person is-a LivingEntity

C:father = {René,...} or (person(x) and person(y)
And hasParent(x,y) and male(y) -> father(y,x)

{father, dad, géniteur}

{husband, spouse, partner}

father, adoptive father, child, male ...

Axiomes, règles
