Reverse Engineering

Definition

Extraction of design, functionality or manufacturing information of an object.

⇒ Reconstruction of a CAD model (= combination of geometrical primitives) from a 3D acquisition (= 3D mesh or 3D point cloud).

S. Gauthier, W. Puech, R. Bénéière, and G. Subsol, "Analysis of digitized 3D mesh curvature histograms for reverse engineering," *Computers in Industry*, vol. 92-93, pp. 67 – 83, 2017.

Reverse Engineering

Definition

Extraction of design, functionality or manufacturing information of an object.

⇒ Reconstruction of a CAD model (= combination of geometrical primitives) from a 3D acquisition (= 3D mesh or 3D point cloud).

- **Problem:** how to ensure exact geometric relations between primitives?

Beautification

- **Solution:** apply some constraints in a so-called *beautification* process.

⇒ Focus on orientations

F. C. Langbein, "Beautification of Reverse Engineered Geometric Models," PhD Thesis, Department of Computer Science, Cardiff University, 2003.

Beautification

3D Mesh

Point 1: x_1, y_1, z_1
 Point 2: x_2, y_2, z_2
 ...
 Triangle 1: P1, P2, P3
 Triangle 2: P2, P3, P4
 ...

Geometric Primitives

Plane 1: $x_1, y_1, z_1, a_1, b_1, c_1$
 Plane 2: $x_2, y_2, z_2, a_2, b_2, c_2$
 ...
 Cylinder 3: $x_3, y_3, z_3, a_3, b_3, c_3, r_3$
 Cylinder 4: $x_4, y_4, z_4, a_4, b_4, c_4, r_4$
 ...

Input: set of primitives (automatically extracted from scan data)
 Output: geometric relations / adjusted primitives respecting them

Before Beautification

Almost parallel cylinders
 (angle between axes $\approx 1.93^\circ$)

After Beautification

Exactly parallel cylinders
 (angle between axes $\approx 0.00^\circ$)

Beautification

Approach 1

Resolve globally the constraint system.

Problems: high computational cost, existence of a solution.

F. C. Langbein, A. D. Marshall, and R. R. Martin, "Choosing Consistent Constraints for Beautification of Reverse Engineered Geometric Models," *Computer-Aided Design*, vol. 36, no. 3, pp. 261–278, 2004.

Beautification

Approach 2

Choose a reference primitive and progressively satisfy relations.

Problems: global consistency, choice of reference.

J. S. S. Chen, and H. Y. Feng, "Idealization of scanning-derived triangle mesh models of prismatic engineering parts," *International Journal on Interactive Design and Manufacturing (IJIDeM)*, pp. 1–17, 2015.

Beautification

Approach 3

Find global reference information and use it to independently satisfy relations.

I. Kovács, T. Várady, and P. Salvi, "Applying geometric constraints for perfecting CAD models in reverse engineering," *Graphical Models*, vol. 82, pp. 44 – 57, 2015.

Global References in CAD

Approach 3: find global reference information.

Geometric Dimensioning and Tolerancing (GD&T)

System for defining and communicating engineering tolerances.

Datum references

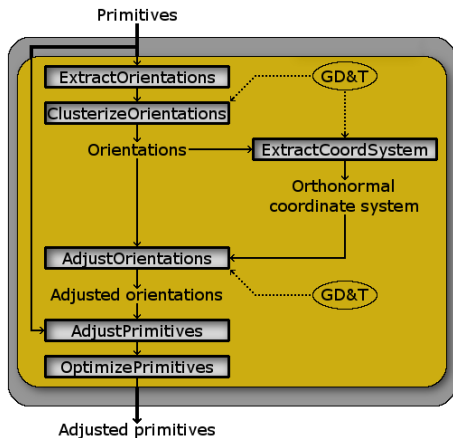

Theoretical planes, axes or points against which measurements are made.

Overview

CAD is based on a **Datum Reference Frame (DRF)**.

⇒ retrieve this **DRF** from the initial primitives and their parameters.

Proposed Method

Datum reference frame extraction

- Extract orientation vectors from the primitives.

a)

b)

Proposed Method

Datum reference frame extraction

- Clusterize orientation vectors.
- Compute an average orientation vector for each cluster.

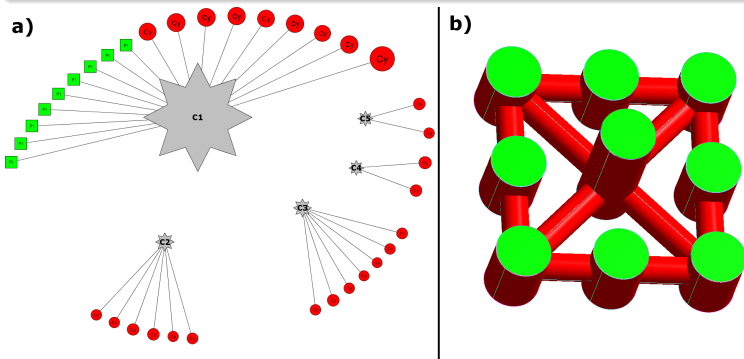

- The average orientation is weighted by primitive area.
- A weight is assigned to the corresponding cluster.

Proposed Method

Datum reference frame extraction

- Compute parallel and orthogonal relations between orientation vectors.
- Build an orientation graph (cluster membership and orthogonality).

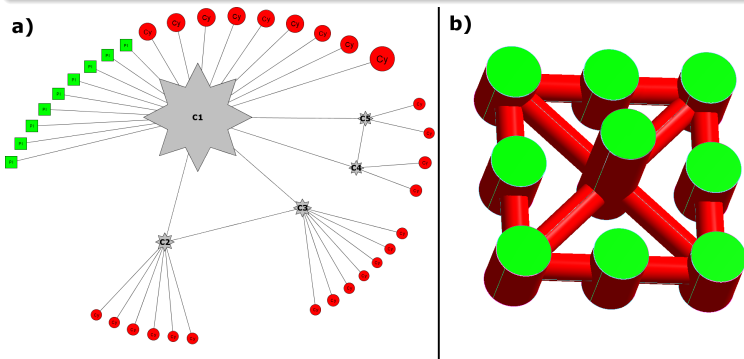

Orientation vectors linked with the same cluster → “parallel”.

Proposed Method

Datum reference frame extraction

- Compute parallel and orthogonal relations between orientation vectors.
- Build an orientation graph (cluster membership and orthogonality).

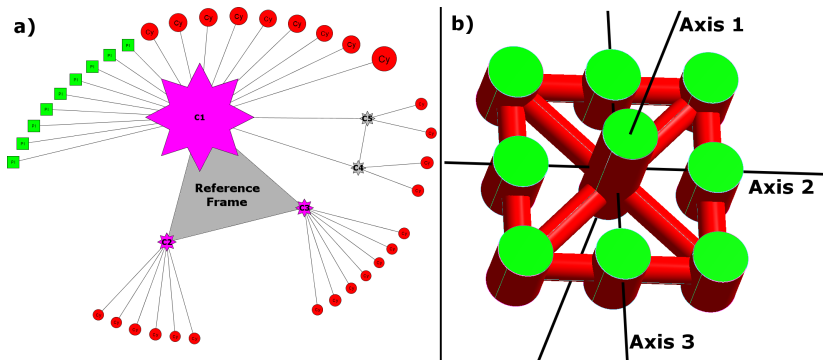

Linked clusters → “orthogonal”.

Proposed Method

Datum reference frame extraction

- Search for cycles in the orientation graph.

Cycle with the highest weight \rightarrow Datum Reference Frame.

Proposed Method

Orientation adjustment

- Compute spherical coordinates (θ, ϕ) from the Datum Reference Frame.
- Quantize the angles θ and ϕ according to predefined GD&T.

Cluster orientations

Spherical coordinates

Quantization sphere

→ Quantization tolerance and specific angles (30° , 45°).

Proposed Method

Orientation adjustment

- Assign quantized cluster orientation to corresponding primitives.
- Optimize primitive fitting on mesh constrained by the new orientation.

$\{x,y,z\}, \{a,b,c\}, \alpha$

Extracted cone
(full optimization)

$\{x,y,z\}, \{a',b',c'\}, \alpha$

Modification of axis vector
(no optimization)

$\{x',y',z'\}, \{a',b',c'\}, \alpha'$

Adjusted cone
(constrained optimization)

Table of contents

- 1 Context
- 2 Proposed Method
- 3 Experimental results
- 4 Conclusion**

Conclusion

Datum Reference Frame (DRF)

Datum reference frames are correctly extracted even with complex data.

Primitive adjustment

Primitive orientations are independently adjusted according to the DRF. Other parameters (position, dimension) are improved by constrained fitting.

Performances

Beautification takes only a few seconds even for hundreds of primitives.

Perspectives

Other relationships

New relationships to satisfy:

Other Datum References

Extract other datum references from the **adjusted** primitives

Thank you

Some questions?
