

**BioinfoGRID**  
Bioinformatics Grid Application for life science

## *In silico* docking against malaria: the WISDOM initiative

Presented by

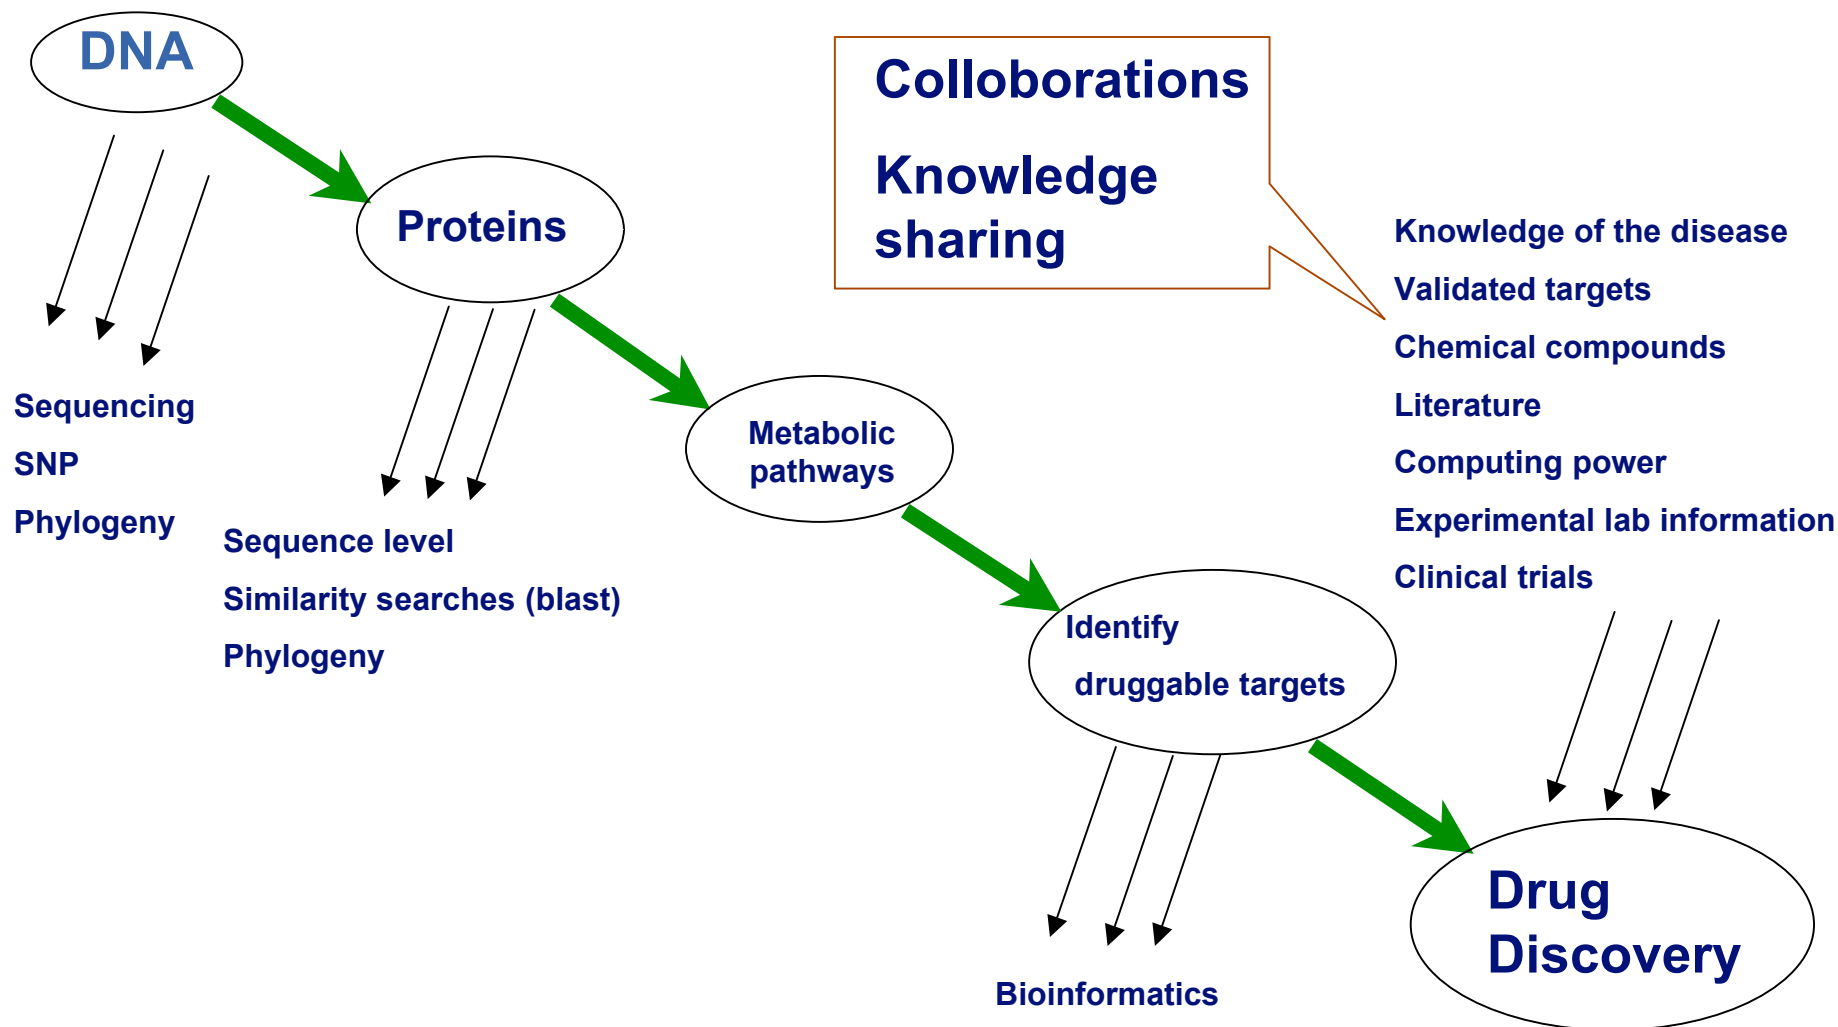

**Vinod Kasam**

Bioinformatics Africa, 31 May 2007, Nairobi

# Bioinformatics and Drug discovery

- **Malaria**
  - Drug discovery and Screening
    - Computational Grids
- WISDOM, Wide In silico Docking on Grid
  - Resources used in Wisdom project
    - Results
    - Issues
    - Conclusions
  - Vision and long term vision

# Introduction to the disease : malaria

- ~300 million people worldwide are affected
- 1-1.5 million people die every year
- Widely spread
- Caused by protozoan parasites of the genus *Plasmodium*

Complex life cycle with multiple stages

# High Throughput Virtual Docking in WISDOM-II

BioinfoGRID

Millions of chemical compounds available

High Throughput Screening  
1-10\$/compound. Very expensive

Chemical compounds  
(**ZINC database**): 4.3 million  
Chembridge ~300,000

Targets (**PDB**): PvDHFR  
PfDHFR, GST, tubulin

Molecular docking (**FlexX**)  
~413 CPU years, 1.738 TB data  
~100,000 dockings per minute

Data challenge on **EGEE**  
~90 days on ~5000 computers

Hits screening  
using assays  
performed on  
living cells

→ Leads  
→ Clinical testing  
→ Drug

- ◆ WISDOM project aims to build a collaboration platform for drug discovery using the Grid computing technology.
- ◆ This project intends to solve large-scale computation and data intensive scientific applications in the fields of drug discovery, Bioinformatics and Biology with the help of computational grids
- ◆ 4.3 million compound database with 3-D structure and physicochemical properties are screened against 4 different targets implicated in malaria to identify potential drug candidates.
- In WISDOM-I, on the biological side, three scaffolds have been identified against Plasmeprin and in vitro tests on the best compounds is under process on the best 30 compounds.

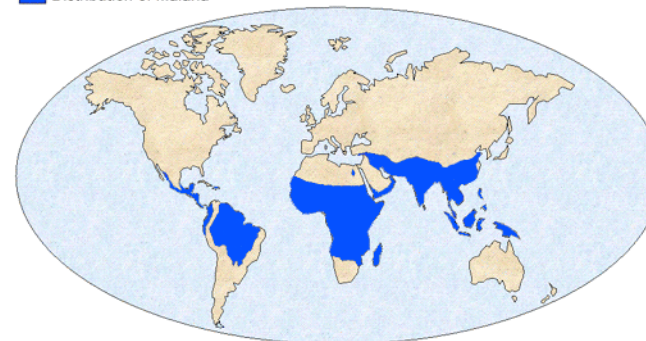

BioinfoGRID

# WISDOM : Wide In Silico Docking On Malaria

- **Biological goal**  
Proposition of new inhibitors for a different proteins produced by Plasmodium
- **Biomedical informatics goal**  
Deployment of *in silico* virtual docking on the grid
- **Grid goal**  
Deployment of a CPU consuming application generating large data flows to test the grid operation and services => “**data challenge**”

Distribution of Malaria

## WISDOM-II - second large scale **docking** deployment

BioinfoGRID

### Malaria target

GST from *Plasmodium falciparum*

DHFR from *Plasmodium vivax*

DHFR from *Plasmodium falciparum*

Tubulin from *Plasmodium/plant/mamal*

### Involved in

Parasite detoxification

Parasite DNA synthesis

Parasite DNA synthesis

Parasite cell replication

### Biology partners

U. of Pretoria, South-Africa

U. of Los Andes, Venezuela  
U. of Modena, Italia

U. of Modena, Italia

CEA, Acamba project, France

# Materials and Procedure in WISDOM

## Targets

Different targets from Protein database and homology models

Chemical Compounds

ZINC compounds

Docking tools

FlexX

AutoDock

Grid Infrastructure

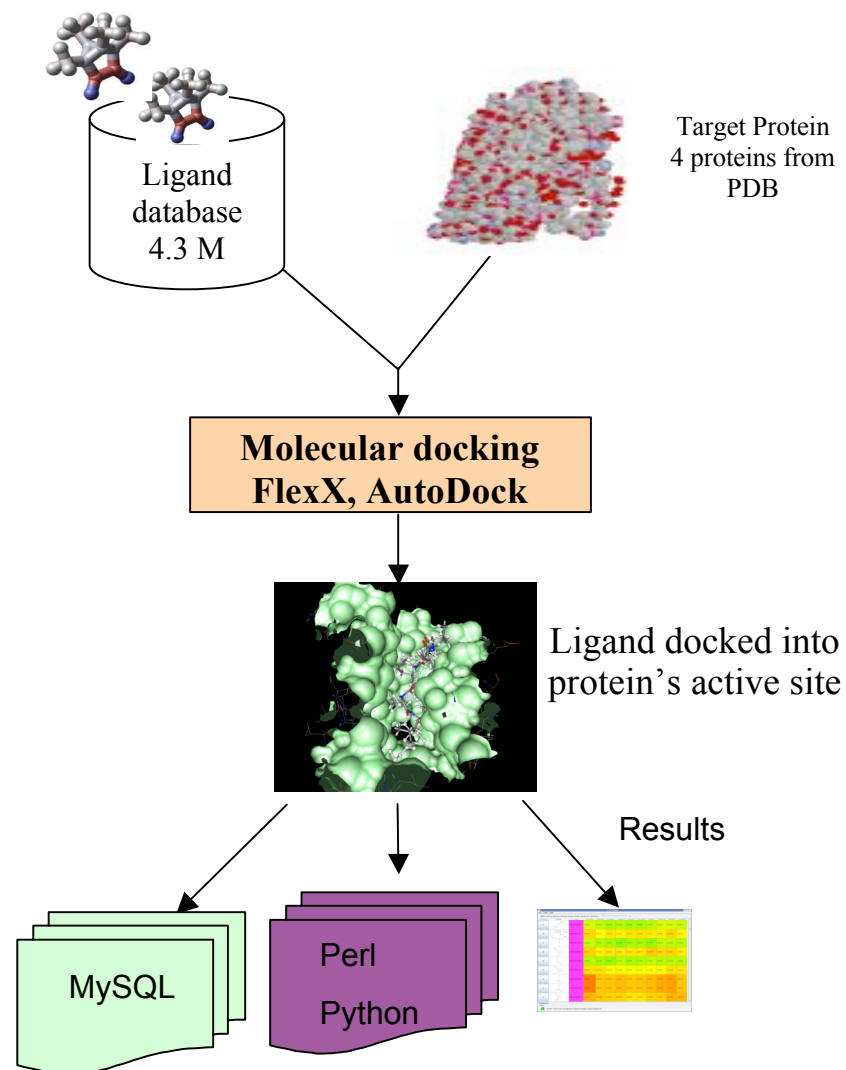

EGEE, EELA, EUChinaGrid

Results

Python and Perl scripts

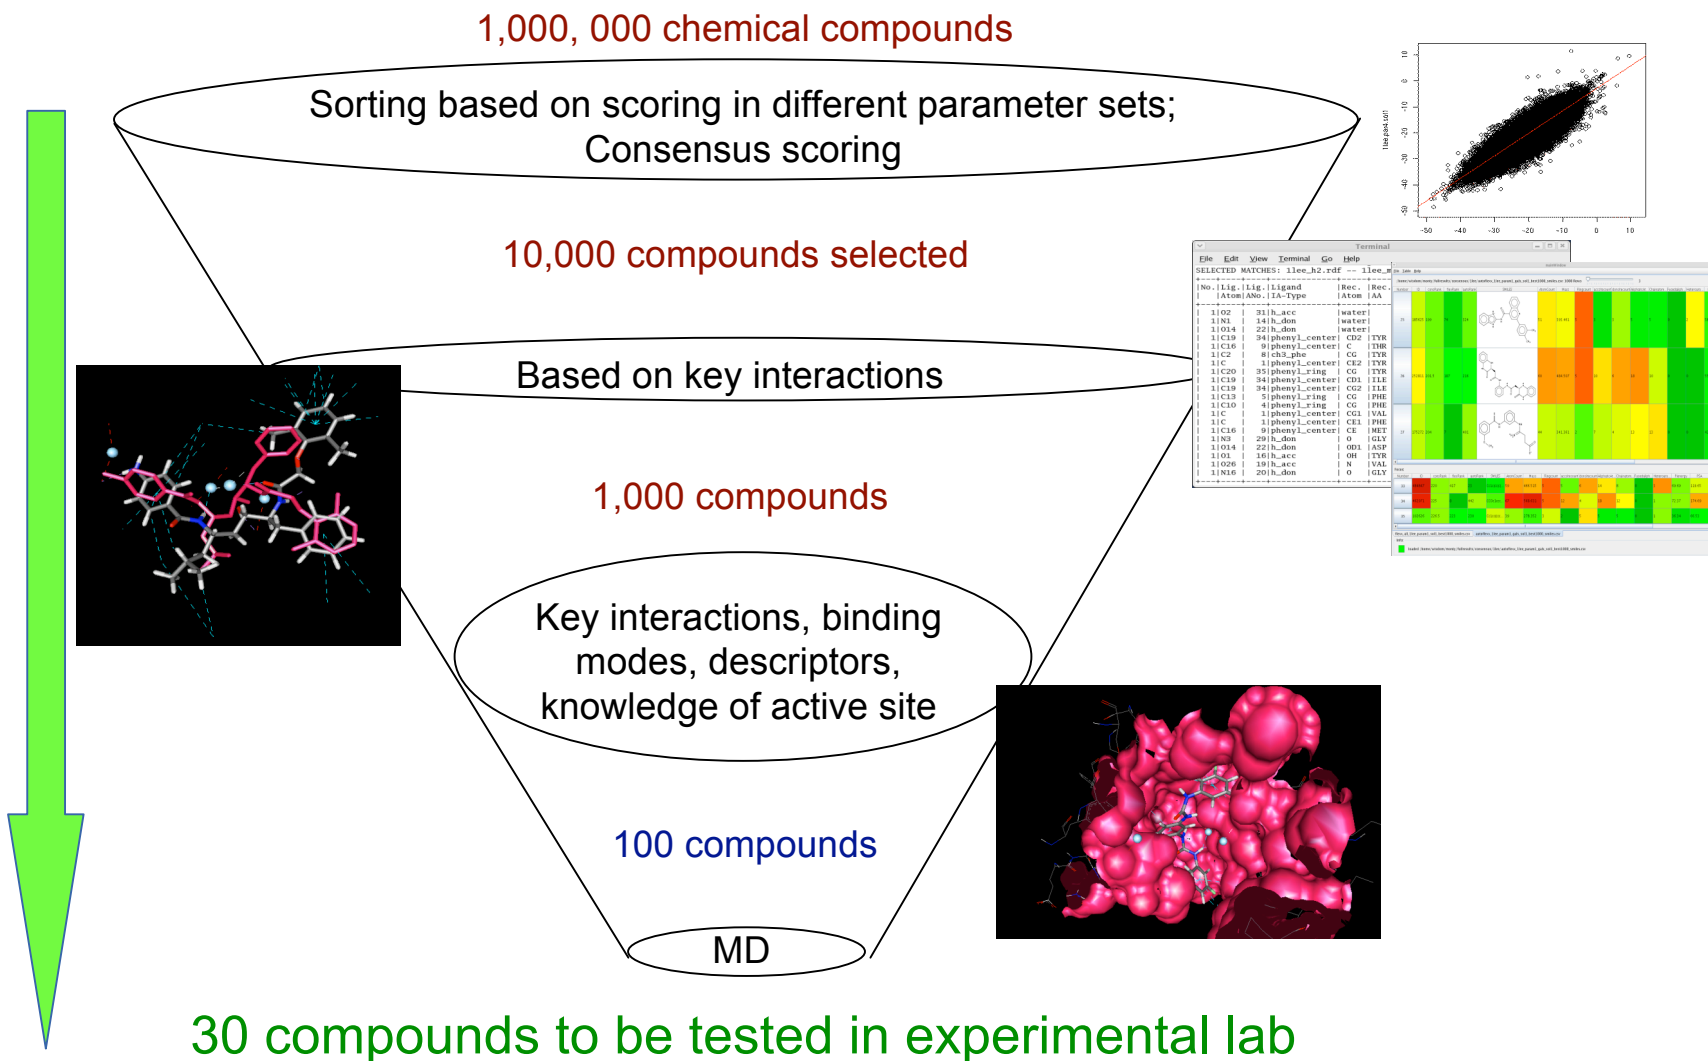

VS explorer

MySQL databases

# Filtering process employed in WISDOM-I

- A grid is the combination of networked resources and the corresponding middleware, which provides services for the user
- Grids are unique tools for
  - **Collecting and sharing information**
  - **Networking experts**
  - **Mobilizing resources routinely or in emergency**

# The different kind of grids

- Computing grid
  - Distributed processors
  - Services to submit jobs, to collect results
  - **Impact: in silico search for new drugs or vaccines**
- Data grid
  - Distributed data: databases, flat files
  - Services to collect, query, move and analyze the distributed data
  - **Impact: collection and sharing of medical data**
- Knowledge grid
  - Knowledge space using ontology to manipulate concepts and run complex in silico experiments
  - **Impact: integration of “wet” laboratories in a collaboration space**

# Instances on different infrastructures

BioinfoGRID

Target Structures	Number of instances deployed
GST (A chain)	4 on EGEE
GST (B chain)	4 on EGEE
2BL9 (P. vivax wild type DHFR)	3 on EGEE, 1 on EELA
2BLC (P. vivax double mutant DHFR)	3 on EGEE, 1 on Auvergrid
Dm_vivax (P. vivax DHFR 2BLC minimized)	4 on EGEE
Wt_vivax (P. vivax DHFR 2BL9 minimized)	4 on EGEE
1J3K (P. falciparum Quadruple mutant DHFR)	4 on EGEE
1J3I (P. falciparum Wild type DHFR)	3 on EGEE, 1 on EuChinaGrid

**Deployment on different infrastructures**  
**Distribution of jobs**

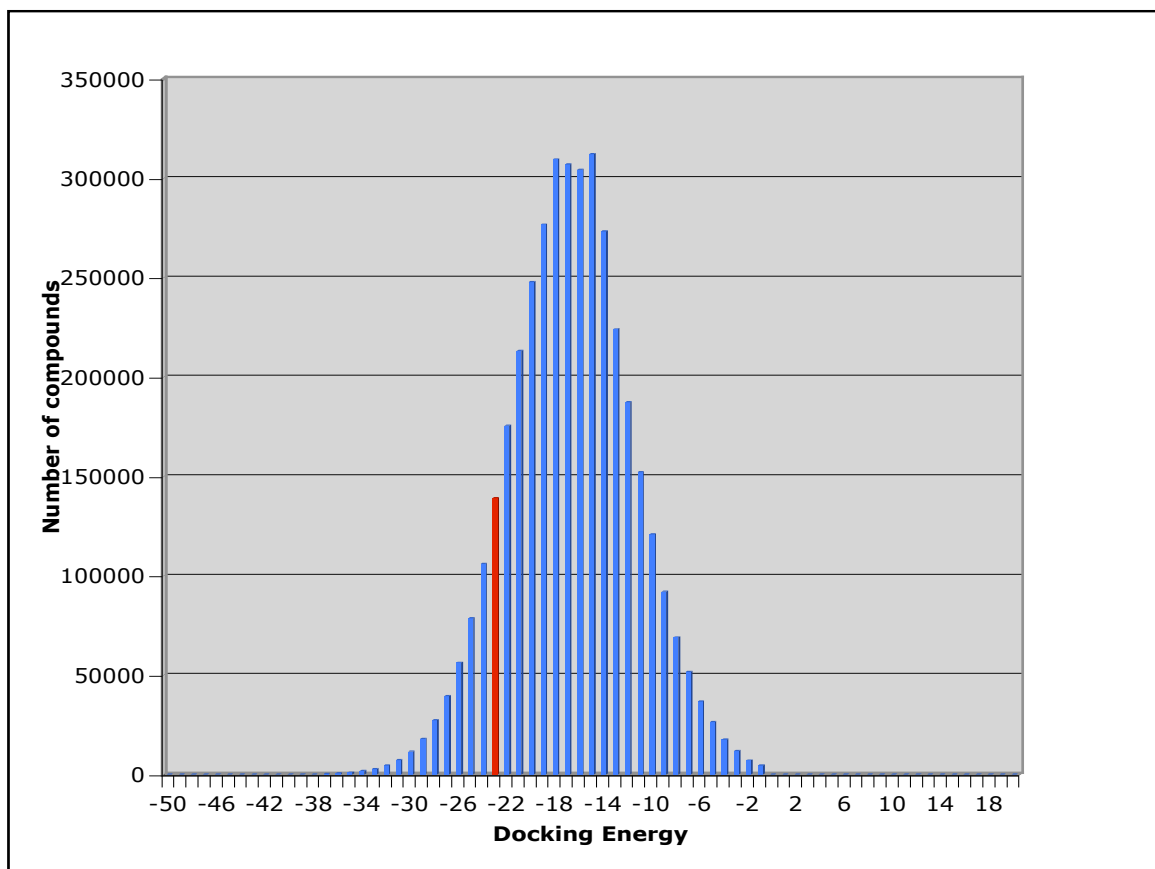

# Statistics of deployment

- First DC:
  - 80 CPU years
  - 1 TB
  - 1700 CPUs used in parallel
  - July 1st - August 15th 2005
- 2nd DC
  - 100 CPU years
  - 800 GB
  - 1700 CPUs used used in parallel
  - April 1st - May 15th 2006
- 3rd DC
  - 413 CPU years
  - 1.7 TB
  - Up to 5000 CPUs in parallel
  - 1st October 2006 - 31 January 2007

Number of Jobs	77,504
Total Number of completed dockings	156,407,400
Estimated duration on 1 CPU	413 years
Duration of the experiment	76 days
Average throughput	78,400 dockings/hour
Maximum number of loaded licences (concurrent running jobs)	5,000
Number of used computing elements	98
Average duration of a job	41 hours
Average crunching factor	1,986
Volume of output results	1,738 TB

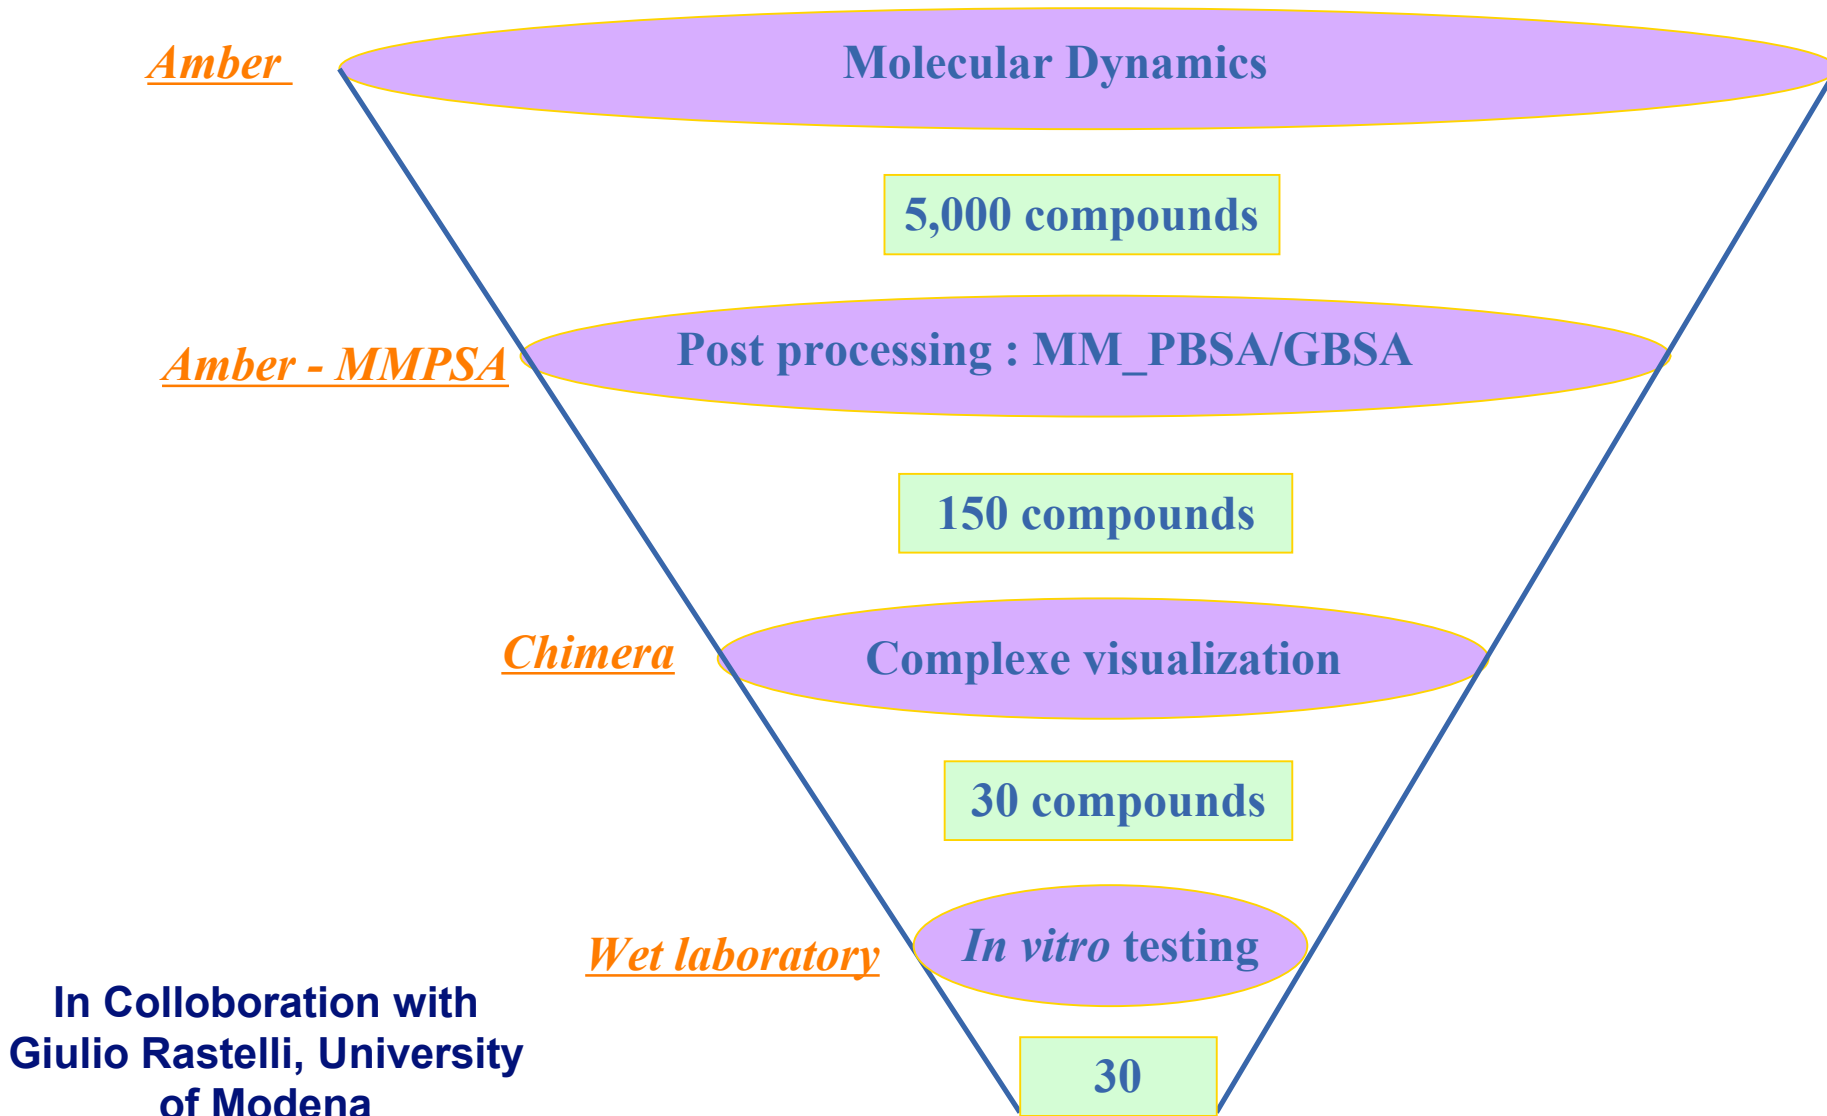

The repartition of docking energies of the ZINC database against GST A structure.  
(The red column represents a score of -24kJ/Mol, the docking score of a co-crystallized ligand (GTX) of GST A chain)

# Molecular dynamics Workflow

# Where grids can help medical development in Africa

BioinfoGRID

- Contribute to the development and deployment of new drugs and vaccines
  - Improve collection of epidemiological data for research (modeling, molecular biology)
  - Improve the deployment of clinical trials on plagued areas
  - Speed-up drug discovery process (in silico virtual screening)
- Improve disease monitoring
  - Monitor drug delivery and vector control
  - Improve epidemics warning and monitoring system
- Improve the ability of African countries to undertake health innovation
  - Strengthen the integration of African life science research laboratories in the world community
  - Provide access to resources
  - Provide access to bioinformatics services

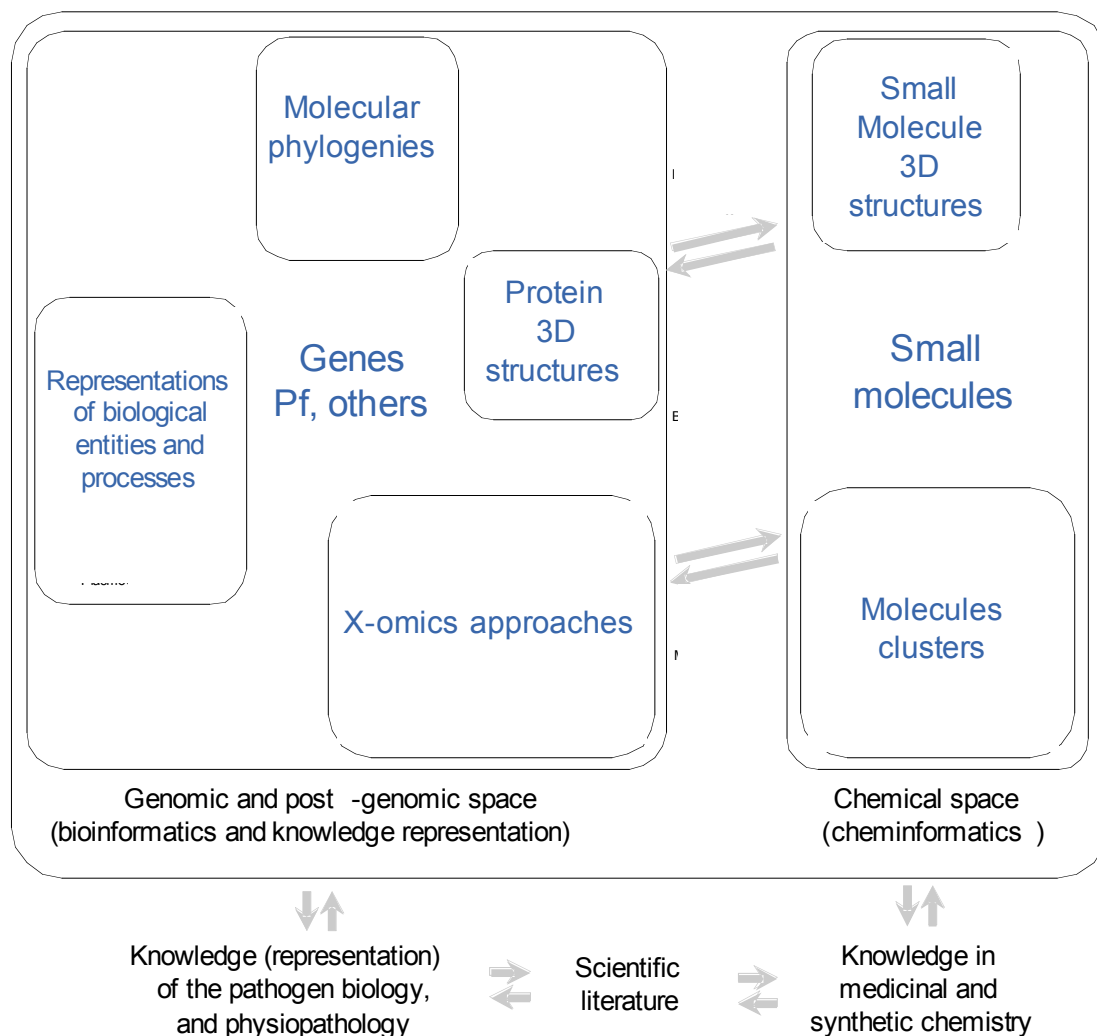

- Grids offer unprecedented opportunities for resource sharing and collaboration
- Grids open exciting perspectives to handle the information flows needed to fight neglected diseases
  - Deployment of services for healthcare and research centers in endemic regions
  - Deployment of infrastructures (federation of databases) to collect biomedical data and improve disease monitoring
  - Cross-organizational collaboration space to share data and resources
- Challenges
  - Infrastructure capacity building in Africa
  - Grid technology must provide the services for data and knowledge management
  - IT expertise and willingness to share information is needed from the participating healthcare centers

BioinfoGRID

# Beyond virtual screening, a chemogenomic space for malaria

## Chemogenomic knowledge space

### Goals:

- comparison of protein sequences
- high throughput reconstruction of molecular phylogeny
- representation of biological processes particularly metabolic pathways
- integration of genomic data, biological representations and functional profiling after drug treatments
- determination and prediction of protein structures
- virtual docking with drug candidate structures

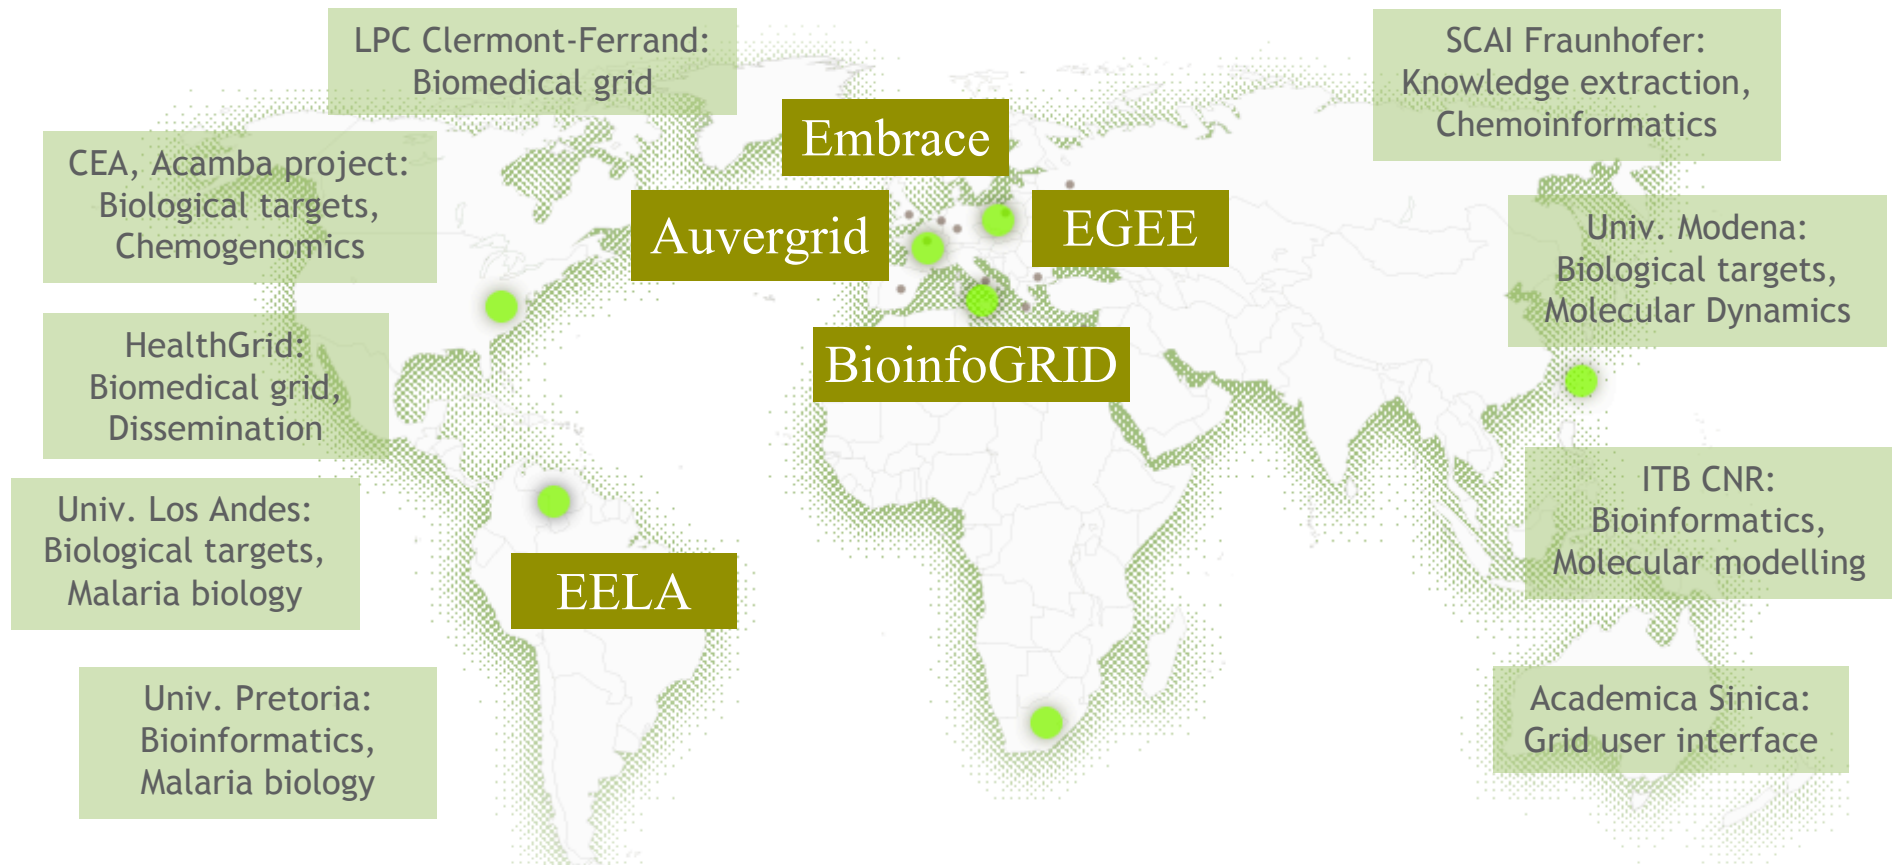

Source: Birkholtz L.-M. et al., Malaria Journal, 2006

- WISDOM proposes a new approach to drug discovery thanks to the grid
  - Rapid deployment of very large scale virtual screening
  - Collaborative environment for the sharing of data in the research community
- WISDOM fully exploits EGEE services and resources.
  - AMGA allows to store securely results and statistics immediately
  - Web Service Interface using WS-I profile guarantees interoperability
- First biochemical results demonstrate grid relevance to the drug discovery community
  - Grid is a superior tool to discover new drugs

# Long term vision: a grid for malaria

**Use the grid technology to foster research and development on malaria and other neglected diseases**

Contacts also established with WHO, Microsoft, TATRC, Argonne, SDSC, SERONO, NOVARTIS, Sanofi-Aventis, Hospitals in subsaharian Africa,

- EGEE infrastructure **open to host other CPU intensive applications** relevant to research on Malaria i.e.
  - Search for drugs: virtual screening
  - Search for vaccines: data analysis
- Grids offer also unique opportunities for
  - Early detection
  - Epidemiological watch
  - Prevention
  - International collaboration
