

# Not Every Domain of a Plain Decompressor Contains the Domain of a Prefix-Free One

Mikhail Andreev, Ilya Razenshteyn and Alexander Shen

July 15, 2010

# Kolmogorov complexity

# Kolmogorov complexity

- ▶ A measure of information in a given string.

# Kolmogorov complexity

- ▶ A measure of information in a given string.
- ▶ One can easily define a set of **Martin-Löf random sequences** (the algorithmic law of large numbers, the algorithmic law of iterated logarithm, etc).

# Kolmogorov complexity

- ▶ A measure of information in a given string.
- ▶ One can easily define a set of **Martin-Löf random sequences** (the algorithmic law of large numbers, the algorithmic law of iterated logarithm, etc).
- ▶ Analysis of running time of algorithms (Moser-Tardos, constructive LLL).

# Kolmogorov complexity

- ▶ A measure of information in a given string.
- ▶ One can easily define a set of **Martin-Löf random sequences** (the algorithmic law of large numbers, the algorithmic law of iterated logarithm, etc).
- ▶ Analysis of running time of algorithms (Moser-Tardos, constructive LLL).
- ▶ And so on...

# Decompressors

# Decompressors

- ▶ **A decompressor** is a computable partial function  $D: \{0, 1\}^* \rightarrow \{0, 1\}^*$ .

# Decompressors

- ▶ **A decompressor** is a computable partial function  $D: \{0, 1\}^* \rightarrow \{0, 1\}^*$ .
- ▶ **Kolmogorov complexity** of a string  $x \in \{0, 1\}^*$  with respect to a decompressor  $D$ :  $C_D(x) := \min\{|y| \mid D(y) = x\}$ .

# Decompressors

- ▶ **A decompressor** is a computable partial function  $D: \{0, 1\}^* \rightarrow \{0, 1\}^*$ .
- ▶ **Kolmogorov complexity** of a string  $x \in \{0, 1\}^*$  with respect to a decompressor  $D$ :  $C_D(x) := \min\{|y| \mid D(y) = x\}$ .
- ▶ There exists an **optimal decompressor**  $U$  such that  $C_U$  is minimal up to  $O(1)$ .  $C(x) := C_U(x)$  is a **plain complexity** of  $x$ .

# Decompressors

- ▶ **A decompressor** is a computable partial function  $D: \{0, 1\}^* \rightarrow \{0, 1\}^*$ .
- ▶ **Kolmogorov complexity** of a string  $x \in \{0, 1\}^*$  with respect to a decompressor  $D$ :  $C_D(x) := \min\{|y| \mid D(y) = x\}$ .
- ▶ There exists an **optimal decompressor**  $U$  such that  $C_U$  is minimal up to  $O(1)$ .  $C(x) := C_U(x)$  is a **plain complexity** of  $x$ .
- ▶ A decompressor is called **prefix-free** if its domain is prefix-free.

# Decompressors

- ▶ There exists an **optimal prefix-free decompressor**  $V$ .  $K(x) := C_V(x)$  is a **prefix complexity** of  $x$ .
- ▶ The difference  $K(x) - C(x)$  can be as large as  $\log |x|$ .

# The main question

# The main question

- ▶ In DLT 2008 paper Calude, Nies, Staiger and Stephan characterized (supersets of) domains of optimal (prefix-free) decompressors.

# The main question

- ▶ In DLT 2008 paper Calude, Nies, Staiger and Stephan characterized (supersets of) domains of optimal (prefix-free) decompressors.
- ▶ One of their results: a recursively enumerable set  $W$  is a superset of the domain of an optimal decompressor iff there is a constant  $c$  such that
$$|A \cap \{0, 1\}^n| + \dots + |A \cap \{0, 1\}^{n+c}| \geq 2^n \text{ for every } n.$$

# The main question

- ▶ In DLT 2008 paper Calude, Nies, Staiger and Stephan characterized (supersets of) domains of optimal (prefix-free) decompressors.
- ▶ One of their results: a recursively enumerable set  $W$  is a superset of the domain of an optimal decompressor iff there is a constant  $c$  such that
$$|A \cap \{0, 1\}^n| + \dots + |A \cap \{0, 1\}^{n+c}| \geq 2^n$$
 for every  $n$ .
- ▶ The main question: **does the domain of every optimal decompressor contain the domain of some optimal prefix-free decompressor?**

# The main question

- ▶ One of their results: a recursively enumerable set  $W$  is a superset of the domain of an optimal decompressor iff there is a constant  $c$  such that
$$|A \cap \{0, 1\}^n| + \dots + |A \cap \{0, 1\}^{n+c}| \geq 2^n$$
 for every  $n$ .
- ▶ The main question: **does the domain of every optimal decompressor contain the domain of some optimal prefix-free decompressor?**
- ▶ We show that the answer is '**NO**'.

# The main question

- ▶ In DLT 2008 paper Calude, Nies, Staiger and Stephan characterized (supersets of) domains of optimal (prefix-free) decompressors.
- ▶ One of their results: a recursively enumerable set  $W$  is a superset of the domain of an optimal decompressor iff there is a constant  $c$  such that
$$|A \cap \{0, 1\}^n| + \dots + |A \cap \{0, 1\}^{n+c}| \geq 2^n$$
 for every  $n$ .
- ▶ The main question: **does the domain of every optimal decompressor contain the domain of some optimal prefix-free decompressor?**
- ▶ We show that the answer is '**NO**'.
- ▶ We build an optimal decompressor  $U$  such that for every optimal prefix-free decompressor  $V$  holds  $\text{dom } V \not\subseteq \text{dom } U$ .

# The construction

# The construction

- ▶ We show that there exists a set  $A$  such that:
  1.  $A$  contains the domain of one specific optimal decompressor,
  2.  $A$  does not contain the domain of any optimal **prefix free** decompressor.

# The construction

- ▶ We show that there exists a set  $A$  such that:
  1.  $A$  contains the domain of one specific optimal decompressor,
  2.  $A$  does not contain the domain of any optimal **prefix free** decompressor.
- ▶ The first part is easy. It is sufficient to require from  $A$  the following two properties:
  1.  $A$  is recursive,
  2.  $A$  is sufficiently dense.

# The construction

- ▶ We show that there exists a set  $A$  such that:
  1.  $A$  contains the domain of one specific optimal decompressor,
  2.  $A$  does not contain the domain of any optimal **prefix free** decompressor.
- ▶ The first part is easy. It is sufficient to require from  $A$  the following two properties:
  1.  $A$  is recursive,
  2.  $A$  is sufficiently dense.
- ▶ By **sufficiently dense** we mean that for every  $n$   
 $|A \cap \{0, 1\}^n| \geq \varepsilon \cdot 2^n$ .

# The construction

- ▶ We show that there exists a set  $A$  such that:
  1.  $A$  contains the domain of one specific optimal decompressor,
  2.  $A$  does not contain the domain of any optimal **prefix free** decompressor.
- ▶ The first part is easy. It is sufficient to require from  $A$  the following two properties:
  1.  $A$  is recursive,
  2.  $A$  is sufficiently dense.
- ▶ By **sufficiently dense** we mean that for every  $n$   
 $|A \cap \{0, 1\}^n| \geq \varepsilon \cdot 2^n$ .
- ▶ An easy case of a result from [CNSS]. Consider an arbitrary optimal decompressor  $D$ .  $A$  is recursive, so there exists a computable injective mapping  $i: \{0, 1\}^* \rightarrow \{0, 1\}^*$  such that:
  1.  $i(x) \in A$  for every  $x$ ,
  2.  $|i(x)| \leq |x| + c$ , where  $c$  is a fixed constant (one can actually take  $c := \lceil \log 1/\varepsilon \rceil$ ).

# The construction

- ▶ We show that there exists a set  $A$  such that:
  1.  $A$  contains the domain of one specific optimal decompressor,
  2.  $A$  does not contain the domain of any optimal **prefix free** decompressor.
- ▶ The first part is easy. It is sufficient to require from  $A$  the following two properties:
  1.  $A$  is recursive,

  2.  $|i(x)| \leq |x| + c$ , where  $c$  is a fixed constant (one can actually take  $c := \lceil \log 1/\varepsilon \rceil$ ).
- ▶  $D_1(i(x)) := D(x)$ .

# The construction

# The construction

- ▶ It remains to build a recursive set  $A$  with the following properties:
  1.  $A$  is sufficiently dense,
  2.  $A$  does not contain the domain of any optimal prefix-free decompressor.

## The construction

- ▶ It remains to build a recursive set  $A$  with the following properties:
  1.  $A$  is sufficiently dense,
  2.  $A$  does not contain the domain of any optimal prefix-free decompressor.
- ▶  $A$  will be, in some sense, a universal set. For every  $n$  consider strings of length  $n$  in the set  $A$ . They determine some subset in Cantor space, which is open-closed.

What is needed for  $A$ : every open-closed subset of Cantor space of measure at least  $1/3$  is represented at some level and even at many subsequent levels

# The construction

# Two games

## Two games

- ▶ Lemma: if  $n_i$  is a computable sequence such that  $\sum_i 2^{-n_i} \leq 1$ , then  $K(i) \leq n_i + O(1)$ .

## Two games

- ▶ Lemma: if  $n_i$  is a computable sequence such that  $\sum_i 2^{-n_i} \leq 1$ , then  $K(i) \leq n_i + O(1)$ .
- ▶ 'Memory allocation' game:
  - ▶ Alice:  $n_i$  such that  $\sum_i 2^{-n_i} \leq 1$  (one by one).
  - ▶ Bob:  $x_i$  such that  $|x_i| = n_i$  and  $\{x_i\}$  is prefix-free set (responds on-line).
  - ▶ Bob wins if he is able to allocate desired strings.

Theorem: Bob wins.

# Two games

# Two games

- ▶ The modified game:
  - ▶ Bob:  $\varepsilon > 0$ .
  - ▶ Alice: makes at most  $2/3$  strings of each length forbidden.
  - ▶ Alice:  $n_i$  such that  $\sum_i 2^{-n_i} \leq \varepsilon$  (one by one).
  - ▶ Bob:  $x_i$  such that  $|x_i| = n_i$  and  $\{x_i\}$  is prefix-free set.  
Moreover,  $x_i$  must not be forbidden (responds on-line).
  - ▶ Bob wins if he is able to allocate desired strings.

**Theorem: Alice wins.**
